> Pick your 1MHz band, and tune away. You'll need to tweek a bit if
> you want to be very far from 15 MHz.
>

If you choose the 31 and 25 metre bands you can receive both with one
crystal in the oscillator.  Many years ago I built a simple converter
using a 10.7 MHz crystal and a tunable front end so I could tune 31 m band
(osc on the high side) and the 25 m band (osc on the low side).  Don't
remember now where I got the circuit but it worked very well with a
standard (in those days!) car radio antenna.

well then I can build another copy of 6m am set given I use partsform
a replica type phone made to look like the 50's it was irrestable to
an old timer

Andy,  Welcome to the group.

A lot of people here want to talk about it and find your point of view on
CW interesting reading.  Just ignore Bill Turdner. Don't let his insults
bother you, he likes to act like an asshole sometimes.  If the ship he
was on was sinking he wouldn't know about it until he was drowning.  As
far as your view that CW is just a hurdle to getting a license, I vote for
keeping the hurdle.  At least when they get licensed they have a skill
then.  To many of them just want to get a license and talk on a
microphone.  Any CB'er can to that.

SC

I am currently in the process of building a eb104 kit. has anyone else built
one of these kits.  What are your thought on this amplifier.

Right click on the link on the left side of the page.
(Selecting the specific show you want to download 1 through 43.)
then select save as......

example: the < http://www.soldersmoke.com/soldersmoke43.mp3 > link

Or copy and paste the url into winamp or what ever is your mp3 player.

AS with any high powered RF device -- or even Pentium 4 microprocessors --
thermal design and proper thermal construction is CRITICAL,
I would use a copper spreader for building this amplifier due to the close
proximity of the 4 RF transistors.

This is NOT a beginner's project or kit
Here are other web sites with thoughts and construction details, notes.

TUBES!! Tubes? Off of Battery, 6 Volt?, Vibrator? Inverter? 12 Volt B+
tubes ? Not since the 1950s ?
Am I reading too much between the lines ?

Yukio YANO, VE5YS

Except for the audio output stage, we can now run a radio on the power
used to to light the Dial on a Tubes Era Radio !

No doubt many are saddened by the senseless loss of James Kim, the family man that perished in the mountains of Western Oregon early this week. I think what makes it all the more tragic is that here was a person who was on the cutting edge of all the latest and greatest high tech computer and communications technology. Blackberries, photo cellphones, wifi PDA's and laptops, etc. I'm stunned a person in such a high tech vector could become so completely isolated in such a short distance from the mainstream.

This worries me because it highlights the shortcomings of all this new high tech gimcrackery. As I understand it, even satellite cellphones require a service provider with a nearby uplink antenna. So, this brings up my question, as a non ham:

How long do you think it would have taken James, or anyone in that situation, to make contact with outside help and get him and his family out of there if he'd had something like a basic QRP tranceiver and antenna and knew how to use it?

Any thoughts you may have on this issue would be appreciated.

nb

> This worries me because it highlights the shortcomings of all this new high tech gimcrackery.

I'm not sure what "shortcomings" you're referring to; no cell phone or WiFi vendor suggests that you're somehow going to be able to get service out in the middle of nowhere, miles from any populated town.

> As I understand it, even satellite cellphones require a service provider with a nearby uplink antenna.

No, plenty are 100% standalone. You're probably thinking of models that effectively act like traditional cordless phones back to a basestation so that the handset itself can be small and light and have good battery life.

> How long do you think it would have taken James, or anyone in that situation, to make contact with outside help and get him and his family out of there if he'd had something like a basic QRP tranceiver and antenna and knew how to use it?

(Assuming an HF band transceiver...) Not long at all.

If he had made various short hikes from the car to the surrounding hill tops perhaps he could have managed to hit a cell phone tower as well and successfully made a call.

> Any thoughts you may have on this issue would be appreciated.

Although we'll probably never know exactly what he was thinking, I've been on the road in question and to most people it justs scream "do not enter!" in winter... at least not without much better equipment and supplies, including a different vehicle.

I'd be curious to learn if he used a piece of mapping/routing software to choose his course; I've seen some that will choose the road he did because it is shorter, in mileage, than the main highway out to the coast -- not considering that the road is narrow, gravel, and otherwise rather treacherous in winter. (Even in summer it's significantly slower than the main highway.)

---Joel

Well, the _right_ high tech gimcrackery (a "personnel locator beacon", e.g. <http://www.landfallnavigation.com/spwff1.html>) would almost certainly have been effective. And I'm sorry for his family's loss, and can appreciate that Mr. Kim must have felt that taking action was necessary to save his wife and children, but had he _stayed_put_ he'd be alive today.

Thanks for posting this Jim. Maybe now people will see that dumbing down ham radio was a bad idea.

Don't worry about my callsign. Just keep practicing CW. No matter how fast
and good you already are at it you can always improve your skills.

I'm sure I've heard he had a mapquest or similar generated map.

> considering that the road is narrow, gravel......

That would have been a flashing red light for me. In fact, I think I took that hwy (42?) from 5 to the coast back in '75. Is that the highway that's the usual detour to the Coast when 5 at Grant's Pass is closed? If so, we did take it in snowy weather at night and were even less prepared than he was (I was real young and real stupid). But, I was smart enough to stay on the road that actually had traffic, including trucks, on it despite it becoming pretty lonesome on some stretches. We also put on chains (the state patrol required it).

nb

I agree...here in the Northern U.S. where we (usually) get plenty of snow and ice, we were taught to stay with the vehicle (and it's always a good idea to have an emergency supply of food and water in the car, especially in the winter months). In the case of an air search and rescue, it's far easier to spot a car on the ground (which is usually very near to a road) rather than spot a person in the woods...

That is really rugged country... And even with a determined multi day
search by air and snowmobile they only found her by accident... Likely
if she hadn't had the umbrella they would have sailed right on past
without seeing her... It is sheer happenstance that any survived..
Given this coddled, technological world we live in, we have lost our
fear of nature... We walk around in freezing weather wearing only a
light jacket, get into a self heating car and drive away from the
suburban streets into rugged country with the Sirius music playing and
the kids banging on the gameboy...But when our technological tools
fail, we are totally unequipped to survive in a situation of being
stranded in a hostile environment...

Could I have made the same mistake? Maybe... But, I am the product of
Northern Michigan, I live in a rural area, I drive 5000# of 4X4 truck,
I usually wear a -20F parka, even to run to the store 2.5 miles away...
Maybe my inherent caution would have made me question that road and
turn around... Maybe not... Glad it was not me...

denny

Official Oregon State maps indicated in red ink the roads
that are closed in winter, off the shelf Rand McNally map did not.

with all the trees out there, too bad he did not carry a leatherman
tool.

burning the tires was smart.

wonder if he knew how to build igloo or other type of shelter.

we never travel in that type of area but
when we do travel by car, got plenty of food,
several boxes cereal for me not the kids !,
cooler with drinks and h2o and several
road flares (makes fires fast) and my 2m/440 mobile kenwood
and ht.

also have old cb from 1975 and it works.

Well put.

Living in northeast Montana teaches one to NEVER go out, anywhere, unless you are prepared to spend time in a hostile environment. There are those who do the same thing every year up here, fortunately it usually has a happier ending. Nature is very unforgiving and could care less who you are, where you are from, what you do, etc., etc. Lose sight of that and forget to respect nature and some hard life lessons will bestow themselves upon you, some of them can, unfortunately, be self critiquing.

> also have old cb from 1975 and it works.

Yes, indeed. Any road trip into the western half of the US (New Mexico and points west) this time of year will see me do these:

- Move the HF rig into the van, as well as the FM dual-bander;
- Install the HF antenna mount on the van;
- Carry a straight key and antennas for 40, 20, and 10 meters;
- Carry both 2m HTs, spare batteries, and battery chargers for them;
- Load up with food, water, cloth blankets, flares, kitty litter, reflective Mylar blankets[1], 2 shovels, and flashlights; and
- Give _very_ serious thought to what _else_ I should carry.

We've got to drive from OKC and back over this weekend, and that's how I'll load up the van today, even though the forecast is for good wx. I've been called an over-cautious fuddy-duddy because I think like that, and I'm still alive because I think like that.

Even on well-traveled roads, you can get into Too Much Trouble in bad weather; back roads in untraveled country are, as we've just seen, far more dangerous.

Garrison Keillor said it very well indeed:

> "Life is complicated, but winter narrows it down to a
> few simple problems: heat, food, shelter, plumbing.
> And it focuses you in wonderful ways. You don't have
> to search for your personal identity in winter; winter
> gives it to you. You are prey in winter; nature is
> making a serious attempt to kill you."

[1] Life-savers when it's _cold_.

Al,

You had the best answer. I never seen so much bs in a thread. When the glue
first came out it was not uncommon for the emergency rooms around the
country to have patients with eyes glued shut. Just like the 84 year old
lady who successfully sued McDonalds because of burning her crotch with
their hot coffee. Now they serve their coffee at a lower temperature.
Doesn't taste as good.

Cordially,
west

I remember reading the MSDS for super glue many years ago and it specifically
mentioned that it wouldn't actually harm your eye, and the best thing to do
was just wait until the skin naturally dies rather than trying to force open
the lids.  Ewwww....

I'm sure it stings like a @#$@ though; just getting my eyes close to the stuff
makes them sting from the fumes.

> Just like the 84 year old

Just to be fair to Ronald, the particular McDonalds in question was serving
their coffee considerably hotter than they own internal guidelines said they
should have been.

> Now they serve their coffee at a lower temperature.

Definitely a case of one bad apple (the restaurant) ruining it for everyone.

Didn't ruin it for everyone, my Mom had already taken care of coffee for me.
She sneaked a dose of castor oil into a cup of coffee to trick me into
drinking it when I was seven years old.
That's the last cup of coffee I ever had. I still detect a slight tinge of
castor oil when I smell coffee cooking.(G) Waagh! I'm just glad she didn't
find a way to spoil the smell of gunsmoke for me.

Roger that! I have a Yaesu FT-857 in my truck so I have HF through 440 and antennas for all bands. I'd be screaming my lungs out on 40M or 20M or whatever band I could raise somebody on!

keep in mind, he, like most of us, was just a middle class guy who had essentially no experience in rugged, snowy terrain. He lived in SF, in the city. His family was going up to visit relatives. How often do normal middle class folks carry a big-ass survival kit that would help them survive for weeks in the snowy wilderness, even when they're driving through the snowy wilderness between two major metropolitan areas?

It just lets us know what everybody who lives in Alaska, or North Dakota, or Montana, already knows -- far away is closer than you think.

This is a direct-conversion receiver: the beat-frequency oscillator operates just off the 7.040MHz frequency. Enough of it leaks out of the unit (especially depending on what kind of case you put it in) to be picked up by your IC-751.

No, the bands are going to get worse over the long haul. We got people that don't want to be skilled knowledgable hams. If they're too lazy to learn CW they are going to be too lazy to learn other things too. Technical discussions will decline. It will start to sound like CB.

I give ham radio fifteen years after the code requirement is eliminated to totally get there, but it will be noticable that it's going downhill quality wise within the first five years.

Just listen to the no-code ignorance on repeaters, you don't think thats no going to migrate to HF?

SC

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.soldersmoke.com

Listen at: http://www.soldersmoke.com

SolderSmoke   #43 December 9, 2006
-- LP filters.
-- Feedback on feedback (in amps).
-- Return loss calc.
-- Exploring Titan.
-- London tornado.
-- Maxwell's equations.
-- TRS 80 Model 100.

-- Name-that-Noise.
-- Book: "Gonzo Gizmos."
-- MAILBAG: AK9N, N2NLY, NR5A, Ramakrishnan

Tired of listening to Led Zepplin or NPR on your I-Pod?   Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

RSS FEED: You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software.
http://www.soldersmoke.com/soldersmoke.rss

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.soldersmoke.com

All our programs are available here.

We hope you enjoy the program. Please send us feedback.

73 from London
Bill M0HBR N2CQR CU2JL

From the European perspective, I do not understand this discussion.
Most European countries (except Russia) removed the CW requirement
after a few months of the ITU WRC decision that CW test is not
required at frequencies below 30 MHz.

I haven't observed any problems with persons using the HF bands
without the CW test.

Listen for yourself, can you tell which European operator has passed
the CW test and which one has not passed the test.

being a tech in USA I am sorry I don't reconize your prefix

US hams are such stick in mud as to opose ANY change ever and claim
the sky is falling

I will corect you

thier is no disscussion going this a merely the last stages of the
long and bitter struge to finsh the task of ending code testing in the
USA

and Id expect this lang to get worse before it gets better

Paul:

If before I did not have reason enough to appreciate European logic, I
do now.

Warmest regards,
JS

I don't know if or when they dropped it), but the Soviet Union had
a no code HF license starting around 1956. Japan also had one
at one time.

From the point of view of the "DX", like you Paul, I'm glad that

the low end of the 40m and 75 meter phone bands was extended. I PREFER
SSB, a 20 meters has been open to the U.S. on "good days" for around
20 minutes.

Due to the influence of the Israel Amateur Radio Club, the code
requirement has been kept. With the IARC's other policies, including
operating events when relgious hams can't operate, pushing for
a five year requirement to convert a foreign license for new immegrants,
etc, they really have become the superfulous old man's CW club,
dragging the hobby down with them.

Geoff.

Other countries are not a problem. Personally I do not attempt to predict
what will happen in the US. However some fear that with easy licensing and

the lax enforcement here that there could potentially be serious problems. They fear a repetition of what happened to the Citizens Band here. With little to no enforcement of violations, that band became such a sewer that you don't dare let kids listen to it.   Recently two CB operators got into a fight over the radio, sought each other out, and one was killed. It is not the world we fear but ourselves.

Actually, in those mountains, a 2 meter hand-held would probably have
given him someone to talk to.

I'm of the opinion that the ARRL feared to give US radio amateurs their independence from morse code testing. :-)

```

I've got an MFJ204 antenna bridge that's sickly. It has bands A thru D. Bands A thru C work just fine. However, only the upper portion of Band D works (usually between 19MHz and 35MHz). But, between 11 MHz and 19 MHz the oscillator is usually dead. I can sometimes get it to spring to life with just the right setting of an attached antenna tuner (or by dancing around the room with aluminum foil on my head), but those techniques should not be required for factory approved operation.

It appears that the only Band D specific component is an inductor. However, I think the band switch works by placing additional inductors in series...so the

Band D inductor is always in the circuit, even for Bands A-C.
Therefore, I
don't think it's the inductor.

Any ideas why the lower portion of Band D might be dead and what I
might look
for?

Details of my efforts can be viewed at http://wa5psa.blogspot.com/
(warning...this web page should not be viewed by someone with a low
tolerance
for watching someone "learn" by mistakes).

Brad

No country should be a problem.

Riley isn't doing his job?

I think what I wrote before one of the recent restructurings was, "What
I fear most about eliminating the Morse Code Exam is a lack of
enforcement, and what I fear most about maintaining the Status Quo is a
lack of enforcement."

A lack of enforcement is a lack of enforcement, and a Morse Code Exam
CANNOT be used as a substitute.

Be sure to collect evidence of USA violations and turn it in to Riley.
Don't just pass it to your OO.

There are loose cannons in Amateur Radio as well.

If you recall, I've never been the one to claim it is any type of filter
etc. I simply think it is one of the basics and for that reason believe a
basic requirement is suitable.

Secretly, the ARRL would like to see the code requirement go away,
but they can't display that outwardly because it will make them look like
they are against having good skilled hams. Rest assured, when the code
requirement is eliminated, the ARRL (Anti-Radio-Relay-League) with try to
come up with a way to capitalize on the dumbing down of the service so
they can get more money in the corporate bank account.

Dee, you were talking about a lack of enforcement and I was talking
about a lack of enforcement. >We< were talking about a lack of
enforcement...WITH REGARD TO MORSE CODE TESTING. You absolutely were
saying its being used as a filter >in that context<.

You came so, so very close to accepting the truth, then you got scared
and ran away.

Not hardly.  I was discussing the fact that OTHER people consider it a
filter. I have never, ever made any statement to that effect.  I was
discussing OTHER'S opinions and fears for the enlightenment of the ham from
another country who asked why it was such a big deal here.

Just because I chose to discuss the opinions presented by some does NOT mean
I subscribe to those opinions.

Dee, N8UZE

Andy writes:

I would like to hear some discussion/advice on the feasibility of putting
an antenna for, say, 30m in the attic versus on top of the roof...

Here is the situation :
The roof peak of my house is about 50 feet and is straight. Given the
need for a dipole which is 44 feet wide, it can be mounted in either of two
places:

1) Just above the roof peak, straight along it, about 1 foot above.

2) Just below the roof peak,inside the attic, about 1 foot below .

Let's assume there are no other options...

So it sort of boils down to whether the wood and asphalt barrier , free
of metal except for an occasional nail, actually attenuates the signal enough
to bother about, or affects the antenna impedance enough to bother about.....

Having made dozens of ham antennae over the last 40 years in

configurations
that probably violate the laws of physics and having had them work, I,
personally,
haven't found that such a difference in the antenna placement makes a
hill
of beans worth of REAL difference (no pun). But a lot of guys here
have been
doing this for 40 years also, and I'd really like to see what anyone
has to say
about it.....

I generally use one rule of thumb on antennae:

" If when I connect the antenna to the receiver, the background
noise
of the receiver increases, the antenna is doing a good job".....

Yeah, I know, but it needs some thinking about because if the cosmic
noise
level picked up by the antenna is higher than the receiver noise level,
then
it has to be working........assuming it is cut to the proper frequency
for the
band used.....

So, what about it ? Anybody want to put in their two cents worth ?

Andy   W4OAH

I have about 300 NOS from military surplus at 100K ohms, 3" shafts by CRL: body at 1.375" dia from the 1940's. I have opened and checked several of them and they all tested as marked. NO stains or rust- most are still in sealed packing. Wt is 2.5 oz sealed or 1.1 oz unpacked. Stock up while they are available. 1-10 ea $0.50 ea, 11-20 at $0.35 ea, 21- at $0.25 each. No 'handling' charges- you pay exact shipping only.

I also have some 1 meg with on-off switch and a few 5K coming soon.

Offered here before going to you-know-where.
Pse check my rating on Ebay for seller: heytubeguy

take a look at some of my other stuff while you are there: tnx

Anyone have an opinion on whether or not crystal cases (e.g., HC49, HC45, etc.) ought to be grounded or not? I've done some Googling, and I've found various cases where people recommend it (albeit without much explanation as to what they think will change when they do it) and no cases where it was specifically not recommended.

Thanks,
---Joel

Most of the time when I've seen crystal cases grounded it has been in crystal filters, where it is supposed to help with feedthru.

I don't know. FT-243 crystal sockets had no means of grounding the crystal case, which likely wouldn't have mattered since except for the metal access side, they were bakelite. But it was pretty common to see a grounding "spring" on HC6 crystal holders, at least those had metal cases. ANd it seems more common to see metal cased crystals on circuit boards grounded than not grounded.

Now, perhaps those springs on the old HC6 sockets were there more to hold the crystal in place. But I always assumed that by grounding them you'd stabilize the capacitance of the case to the rest of the crystal. If you just leave the case ungrounded, then external things can affect that capacitance.

Obviously the case affects the tuning of the crystal. I remember one guy writing in CQ forty years ago where he'd open up HC6 crystals so he could grind them on frequency, and he made the point that he couldn't measure the new frequency accurately unless the case was back on at least partially. Given that, if you ground the case you put things at a known level.

If nothing else, grounding the case adds mechanical stability. WIth that in mind, is there some reason you can come up with why you shouldn't ground the case (trying to figure that out might help to figure out whether they should be grounded).

Michael VE2BVW

So, can you bend it down a few hundred megahertz into the amateur 10GHz band? Without spending more than you would for a Gunnplexer?

I have a copy of the old ARRL "Radio Designer" software, but it does not run on modern OS's, and ARRL has not renewed their agreement with the author.

Can anyone recommend a similarly capable software package which will run on an XP platform. Need not be freeware, but also cannot afford a professional 'commercial' package.

Suggestions?

The Man in the Maze

I have the Windows XP on a 2004 Dell computer, and the Radio Designer program works perfectly. I have been using that program ever since it came out, no problem. Your difficulty can probably be fixed by the right technician.

I also have ARRL Designer running fine under Windows XP, on an HP Pavillion computer. However, I have had problems in the past with compatibility with certain video cards, especially under Win98.

I also graduated from Win 98 Dell and had no trouble. I am sure the problem
can be resolved, although I am not the right person to do it.

For most solid-state oscillators it makes sense to ground.

For tube oscillators where the two pins to the crystal could be at high potential, it is probably better to not ground. In some Pierce or Modified Pierce oscillators you find either plate or screen potential; nominally this is supposed to be blocked by a ceramic capacitor (e.g. 0.001uF) in most designs but you'd be surprised how often this was left out!

Tim.

I am looking for a free oscilloscope program for the PC to run under Windows XP.   Does anyone have any preferences ? It needs to be quasi-real....not just a toy, but it can be very simple. I have no need for spectrum analysis and single trace would suffice, but I do need a calibrated timebase, for example. So far what I have found does not meet my needs (time axis won't run slow enough, uncalibrated timebase, doesn't quite work properly on my computer....etc.).

Steve

What is bandwidth required? There is good 'winscope' available free
for
frequencies upto 20Khz.

LOL what? An oscilloscope is hardware, what are you gonna do with
software without hardware somewhere? What are you gonna scope with this
program????
I mean you can download a free logic analyzer program, but without the
hardware what's the use?
Here's a free software that lets you control an oscilloscope...
http://www.rigolna.com/support_download.aspx

So it's free, and then what??

Bandwidth required is whatever the sound card can provide....so 20 kHz is fine. But the WINSCOPE I have found (by Konstantin Zeldovich) is limited to a 50ms scan time. I want to measure time differences of up to at least 100ms so this is not adequate.

But thanks for your suggestion.

Steve

Sound card !

> I mean you can download a free logic analyzer program

That could be useful in some circumstances....any suggestions as to good ones (that don't use serial ports as it has to run on a modern notebook) ?

Take a look at:

http://www.cleverscope.com/download/

They claim to have sound card support, so it might be worth a look.

You can always use a USB to serial converter.

I'd suggest trying out Ansoft SV,
http://www.ansoft.com/ansoftdesignersv/capabilities.cfm. I think one can make
a good argument it's -- by far -- the most powerful free RF simulation tool
out there. The user interface is a little odd, but only a little -- nowhere
near as different as, say, Eagle PCB is. There's a excellent tutorial for it
here:
http://www.elektronikschule.de/~krausg/Ansoft%20Designer%20SV/
English%20Tutorial%20Version/index_english.html

...by Gunthard Kraus.

There's also PUFF which... holy deja vu, Batman!... Gunthard Krauss has a page on getting to work with Windows XP. Sayre's book, "Complete Wireless Design." is almost the unofficial manual for it. It's nowhere near as powerful as Ansoft, but you might want to try it out anyway; in its day it was really quite good.

Bush league amateur stuff! What probe can you use? What can you probe worth a damn with 20Hz-20KHz? Except audio itself?

Sure, here's the free program. When you're ready, buy the logic analyzer and stop wasting time with bush league amateur stuff. It's your time to waste, but life is short.

Amidon sells the Fair-Rite toroid 5977003801 as Core Number FT-240-77 @ $9 each. In an attempt to get a better price, I contacted Lodestone Pacific and was told that this particular item has a "grid" of 50 which means their minimum order quantity is 50. I don't mind ordering 10 toroids, but 50 toroids would last me several lifetimes. A company called Kreg Component also handles this item, but it is on back order. Any suggestions on where to buy this toroid at a better price than Amidon?

This has come up in the past, ever since the ARRL stopped selling the software. Go to groups.google.com and do a search of this newsgroup using <arrl "radio designer"> as the searchwords. You're at least going to find discussion about alternatives after the ARRL version left the scene. It was apparently a truncated version of some commercial software and at one point at least there was a free student version of that commercial software. Read the threads, and it may be helpful finding an alternative. Though perhaps enough time has elapsed that the alternatives mentioned have passed into history also, or don't run on recent operating systems.

It should not be impossible to get a 100$ FPGA board, generate a VGA display,
use a 100MHz flash DC and have 100MHz logic analiser / digital storage scope
for little more then that plus the price of the probe and a few discrete
components.
Like for example here:
 http://www.fpga4fun.com/
 http://www.fpga4fun.com/digitalscope.html

I would suggest "LTSpice" from Linear Technology. A freebie!

A full SPICE program that includes a schematic-capture option in addition to the regular Netlist circuit entry. NO limitations on number of parts. Some general-purpose models included in supplied library. Runs fine on my XP Home operating system. Allows printout of schematics, waveform-response displays from my system.

This SPICE derivative was originally supplied as a marketing aid to demonstrate Linear's switched power-supply ICs...and apparently someone at Linear had the bright idea to supply it as a freebie. We can all benefit from that "marketing mistake" and enjoy a full-on SPICE program.

I've already used it for a few months and find it matches the commercially-packaged products from Intusoft and Orcad. Yes, it does do oscillators without any need to add special components to start one up. :-)

As with all SPICE derivatives, those not familiar with SPICE have a learning curve that might be steep. By now, though, SPICE is rather standardized and - usually - what is written about them in the recent past will apply here. The schematic-capture drawing function (converts automatically to a Netlist) is a bit clunky to use but then so are the commercial programs that have that.

So far, the supplied models in LTSpice Library all seem to follow the actual parts...such as with workhorse 2N3904 and 2N3906 and 1N4148 semiconductors, plus some others such as a few LEDs, several standard zeners. Some of the inductors and capacitors used with switching supplies are in the Library with reasonable internal characteristics (ESR on electrolytics, DC resistance and interwinding capacity on coils). One can add other SPICE models with a supplied model-entry function but I've not tried that yet...that be a prodigious side project. There's a couple of websites devoted to using LTSpice already on the 'web, one of those for modeling audio TUBE amplifiers.

www.linear.com   Look in, about 5 MB FREE download.

Probably not if the tuning element is a DRO.

Bill

Thanks for the link - by sheer co-incidence I was also looking for something
like that, and it looks like a good one too.

The DRO has a tuning slut above it. You might be able to tune off frequency by a few MHz. The DRO puts out very little power <-30dBm might be a good idea to add an amp from mini-circuit, smdi, rfmd or hittite microwave, you should be able to get free samples from those companies. Another idea is to just get another puck in place of the one in the cavity. free sample pucks are available at shf microwave.

Also you might try trimming the cavity to give it more area thus decreasing the
frequency.
BTW, These guys sell pucks
http://www.morganelectroceramics.com/microwave/puck_resonators.htm

Yeah, but I have high speed. I can afford it. You, well now I understand why you like CW so much. It goes well with the spark gap that you use...of course most hams have real equipment, but you can only use what you can kludge together with old beer cans and salvaged copper wire.

Ansoft's Designer SV is available as a student feature-limited download, and is the replacement for Serenade SV, upon which the ARRL program was based. I DL'd the demo, and IMHO, it is not oriented toward the HF RF market.

You won't find it onAnsoft'sr web site, but Serenade SV 8.5 is still available. I sent Ansoft an email, explained that I would be using it for amateur R&D/experimentation for the purpose of publishing in amateur periodicals (which is true - QRP Quarterly), and they agreed that if the Ansoft Designer SV did not meet my needs, they would try to find a CD of Serenade SV and send it to me. In the meantime, doing some serious Googling, I found a copy on a university web site, and I used that. It runs fine on XP.

If you search the ARRL web site, you'll find some examples in the January 2001 issue of QST that explored Serenade SV.

Good luck!

With respect to "what can you measure", do some searching on mixing RF
signals down to baseband, for example, to look at 9 MHz crystal filter
performance. There have been numerous threads on Yahoo groups lately
on that, so you should be able to find some info.

Hmmm..now you have me thinking about what can be done with this "bush league" test equipment and a downconverter....I'm thinking perhaps two-tone intermodulation tests on RF amplifers....Cleverscope does have a spectrum analyzer....

Steve

There's been quite a bit of discussion about the radar gun on the Microwave mailing list,   http://www.valinet.com/mailman/listinfo/microwave and a bit on http://www.austech.info/showthread.php?t=135840

I ordered two.

John,

It's tough to find better pricing in low quantities. Considering that
even small toroids are at least $0.50, a big one like FT-240-77 for $9
doesn't seem out of line for 1~10 pcs. At least Amidon makes it possible
to buy in such small quantities. Another good supplier is Ocean State
Electronics (http://www.oselectronics.com) and their price is $8.75.

So, whatcha building anyway?

Yes, Amidon's price is fair, but if I can buy 10 of these large toroids for $6 rather than $10, I would probably bite.

These toroids are for use as common-mode filters for wires leading to/from electronic equipment. My ham rig operates primarily in the bands between 1.8 & 21.5 MHz.

You might want to check with electronic-surplus stores. Most of the
ones around here have a fair supply of ferrite cylinders and toroids

of various sizes (some pre-wound with wire, others bare). A lot of them appear to have been intended for power-supply filtering applications of one sort or another, and might be suitable for your needs.

Being that they're ferrite, there's little or no standardization in labelling or color coding (and many of them are "naked" ferrite with no coding at all) - you'd have to buy a few, and then run some inductance-vs.-frequency tests to see if you could figure out what sort of ferrite mix was used and whether its inductance and loss in your frequency range is acceptable.

It's a bit of a carp-shoot, but if you're lucky you might be able to pick up a bunch of usable ones (if not necessarily of the exact same size and mix you were thinking of) for rather less money... maybe as little as a dollar or two each.

Hmmm. As an example, I just checked one surplus dealer (www.mpja.com) and see that they have a Magnetics ferrite toroid, 1.9" OD, made by Magnetics, of a type "J" ferrite mix (permeability 5000), intended for EMI/RFI filtering (and for broadband transformers below 1 MHz). Data sheet for this mix can be found at

http://www.mag-inc.com/pdf/Ferrites/2006_Materials_J.pdf

MPJA sells these for $3.95 each in onesies, $2.95 if you want 20 or more. If those would do, you could buy 20 for the same $60 that you were hoping to be able to spend for ten of the Fair-Rite toroids.

Hi Alex, You sound like a brand new no-code Tech. Welcome to ham radio.

All those computers you mentioned will work fine, but if you really want
to do any serious computer work you're going to want to invest in a Vic
20, or a TI-99, or a Commodore 64. Power users swear by'em.

I know what you mean Dan. With the anticipation that ham radio is going
to get dumbed down again real soon, the dumb-it-downers like Lenny,
Markie, Opus and a few others are really trashing the groups with anti
code test hate. We can only hope the code requirement is retained and
increased so that they can't get on HF and mess that up too.

No you don't.  You're one of the foul-mouthed off-topic posters that
Dan is complaining about.

> With the anticipation that ham radio is going
> to get dumbed down again real soon, the dumb-it-downers

It got "dumbed-down" when a license was issued to you.

BTW, what is your call?

BB's call is well know and esily located

My and My name are at the the top of the Page

your call if any and Slow Code's call are something you are rightly
ashamed to post

I wouldn't blame him for being ashamed of it, but for what it's worth,
his call is W4NTI.

Any IBM PS/2 model would be perfect. They can be had for next to
nothing and are well-nigh indestructible.

Hi Sam,

Actually I love your setup! When I as single I had an office scarily similar to what you have now, and we even have alot of the same books! I even have those two boxes of Suse 7.2 and 8.1 on my shelves, plus OS/2, though mine's 3.0 Warp (still shrink wrapped btw).

When my wife and I married last year and she moved in, our offices got consolidated and most of my books got put in the closet. It's fine for the most part as most of the books I don't use, but it's still neat to walk into an office and have floor to ceiling computer books :) Always something on hand for those late nights when you can't sleep. hehe

A friend of mine has a C64 he's not using, and he plans on sending it to me. Also another guy I met on QRZ is sending me his old cable he used with the Tandy TRS-80 Coco 3 to do packet radio. It goes from the RS-232 port to a TNC, so maybe I can get something going there.

So tons of fun stuff on the horizon!

Take care, and thanks for the pictures! I love'em!

Alex

Hi SC,

Yup, I got my tech ticket a few months ago, and I'm now working on learning code and studying for the general ticket. I hope maybe January or February, but not until I can get my ham nook setup in the garage plus move my radio from the car to the garage so I can actually focus on the radio :) It's hard learning how to ragchew while on the interstate. hehe

I do have a C64 on the way, and that plus what I have now should be enough to get me going. Too much fun!

Take care,

Alex

Bill Turner (whatever that W6WRT means, noone cares i am sure):

The only idiot that we all can see who replied to the original email is
YOU!!  Stop being you please...

I re-read the message below, from the best deal ever etc..., its not
like they are saying hot mommas with live web cameras...they are
selling a product which is legit.  There are 5 million new businesses
in a year in this country alone that dont have a website.  Why dont you
leave your wise comments to yourself..

Do we enjoy seeing unrelated messages in our groups, NO! but just
because YOU wasted a second of your useless time, it does not mean that
you can make remarks like that...just ignore their message and life
goes on...No need to be rude.

Thanks,

I have a Harris filter in my junk box, or at least I think it is a
Harris filter.
On top of can:
P/N 700-0423-00
FREQ 10.000 MHZ
T136
SN. 6385

Does anybody have any info on this guy?
He is  1-3/8"L x 1"W x 3/4"H (approx.) and has five pins - three on one
end and two on the other. It is totally sealed 'can'

I guess he's in good company then, Brain...There's you, Morkie, Lennie, Frankie, and Toiddie to keep him warm!

> > With the anticipation that ham radio is going
> > to get dumbed down again real soon, the dumb-it-downers
>
> It got "dumbed-down" when a license was issued to you.

Pot / Kettle / Black

> BTW, what is your call?

What does it matter, Brain?

You don't sign YOUR call here!

You unceremoniously dropped your "billybeeper" personna for "hot-ham-and-cheese", trying to hide your identity until your ego overcame situational awareness and you did sign a post.

I can't help but wonder which one of the other annonnies may be you right now...Afterall, that is your MO.

No matter...You'll do it again...You'll let your ego get ahead of your common sense and you'll out yourself again. You always do.

Steve, K4YZ

```

All,

I've been hearing how winding coils on discarded plastic pill bottles is not suitable for RF tank circuits due to low Q, and that these would not be safe for tube circuits anyway due to melting point.

I have access to kaolinite clay (white porcelain) and a kiln, and I was wondering if I molded and fired this type of clay for coil forms, what effect on a tank circuit Q this form would have.

Thanks in advance,

The Eternal Squire

Are you remotely aware this is a newsgroup for Amateur Radio Operators
who like to build (i.e. homebrew) their own equipment?

If your "legit" product is not related to the homebrewing of radio
equipment, it does not belong here.

That mysterious "W6WRT" is my amateur radio callsign. What's yours?
```

Bill, W6WRT

What frequencies are your coils going to be operating at? I'd be really surprised if pill bottles had any significant loss at HF.

You must be talking pretty high power designs if you're able to melt plastic!

Is it a filter? It sounds more like an oscillator.

Although the frequency is probably not the same as what you're going to use the coils for, one way to test the loss of an insulator material is to put some in the microwave oven (along with a mug of water to provide a load for the magnetron). If the insulator material gets hot, then it is lossy. Of course you would have to fire the clay before testing it, otherwise the water content would make it get hot anyway.

If the pill bottles are polypropylene or a similar non-polar plastic then they are probably not very lossy, but of course if the current through the wire makes the wire hot by normal I^2*R losses, then the hot wire would melt the plastic. This would only be a concern in a power amplifier or tube circuits as you mentioned.

Chris

Post restructuring License EXAM

(Simplified test approved by all book and magazine publiher and VE whorehou$e$ who $ay �We need more ham$�)

Please PRINT (that means no squiggly lines)

YOUR NAME (what they call you) ______________________________________

ADDRESS (where you live) ____

BIRTHDATE (when you were born) ________________________________

EXAM

Instructions: Make a circle (one of these round things O) around the letter of the best answer! This is so we know what your answer to the question is!

1. You TALK into a microphone with your _______.

A. Hands
B. Feet
C. Toes
D. Mouth
E. Armpits

2. When you talk into a microphone, you talk into _______.

A. the front
B. the back
C. the top
D. the bottom
E. the wire

3. �HEADPHONES� are worn over the ___________.

A. Knees
B. Eyes
C. Toes
D. Ears
E. Lips

4. What do you do with the AC line cord coming out of a power supply?

A. Hold it in the air to pick up signals
B. Pull on it to start the motor
C. Talk into the plug to get real "skip DX"
D. Hook it to your antenna
E. Insert the plug into a source of power

5. A �two meter� radio is:

A. twice as strong as a one-meter radio
B. two one-meter radios in series
C. a CB with two meters on the front panel
D. a good doorstop
E. yo mama

6. A "ten-foot mast" is how long?

A. Ten feet
B. Ten pounds
C. Two meters
D. Tree-top tall
E. yo mama

7. A �Triband antenna� is made to work on how many bands?

A. 1
B. 2
C. 3
D. 4
E. 10

8. The �Marconi� antenna is named after:

A. Marconi
B. Mantovani
C. macaroni
D. Dean Martin

E. yo mama

9. What colors of DIODES can you buy at a Radio Shack store?

A. Red, blue and black
B. Red, yellow and green
C. Orange and brown
D. I am colorblind so this is a discriminatory question and I should automatically get my license because you have been mean to me.
E. I have no intention of ever using DIODES, so I should get my license for free.

10. What color of SLURPEE can you buy at 7-11?

A. Red, blue and black
B. Red, yellow and green
C. Orange and brown
D. I am colorblind so this is a discriminatory question and I should automatically get my license and free slurpees forever because you have been mean to me.

END OF EXAM.

YOUR SIGNATURE (slap yo tag here)

Scoring:

Get THREE correct and you get an EXTRA!!!!
Get TWO right and you get an ADVANCED!!!!
Get ONE right and you get a GENERAL!!!
Miss them all? Just blow the VE and get a no-code Tech Markie!!!

FWIW, I looked at a number of old pill bottles out of curiousity, they are all marked PP No.5 which is Polypropylene. Checking in a microwave oven sounds like a good idea.

If you can translate Fair-Rite's part numbers (obvious after awhile),
CWS Byremark has an extensive stock of all types with reasonable price
and shipping.  For common types, it's had to beat Diz's bundles at
kitsandparts, though.

I have built a Tiny Tornado on 40m. It TX and RX fine. I have my ICOM751
tuned to 7.040 for help in tuning. I notice that when I turn the Tornado on,
I get a solid tone. It does transmit fine, but when I release the key, I get
this solid tone. Anyone else experience this?

Thanks,
Doug / KB8M

That is normal, got the same thing in mine. Its the oscillator that runs
all the time.

I think that's what it appears to be but I can't find any information
on it that way either.
Any ideas?

There will be very little effect on Q of an inductor wound on a 1/16" to 1/8" thick wall of translucent plastic as used in pill bottles...as compared to ceramic or epoxy-paper or other plastics as used in commercial coil formers. A quick check on any Q Meter will prove that. [I've done that out of curiosity many many years ago and little change]

A visual clue is the old B&W "coil stock" of heavy wire held in place by cemented-on strips of polystyrene (usually in four strips per long coil stock, equidistant around the circumference. Those were used in the 50s and 60s primarily in tube amplifier circuits under about 200 W.

Using ceramic formers for anything under 400 W (give or take) power level is overkill in insulation. Back in the 30s and 40s use of ceramic was easy in the industry (plastics industry hadn't developed far yet for electronics applications)...so already-in-place ceramics work was an easy way to go for manufacturers of "radio parts." That led many to believe that ceramic forms are "necessary."

The BEST way to go is to sit down and do some grunge work of calculation of RF currents and voltages in a power amplifier L-C network...to see what ACTUAL loss will do insofar as heat dissipation. Q - as measured - will be the same a low or high power levels so the measurements at low levels will still apply to high power applications.

If heat dissipation is a real concern, then that can be simulated with simple AC through a resistance wound around the former in question. Any resistance wire will do, such as the elements out of an old toaster, hair dryer, etc. Set the low frequency power dissipation the same as what was calculated for RF and watch the results.

By the way, some pill bottles are still molded from polystyrenes with some high end medications stuffed in (of all things) polycarbonate (expensive) containers. The much-storied "Q Dope" (supposedly so great to use on small coils, which it isn't in longevity) is polystyrene with lots of solvent. Q Dope will pull away from most surfaces ("lifts") after several months due to adsorbed moisture in the air, losing some of its good properties. Spar or boat varnish (from petroleum products) is better and longer-lasting, doesn't smell as good as Q Dope but can also be used on floors and furniture. I use McCloskey "Gym Seal" myself...rather expensive in do-it-yourself stores, though.

Just having some kind of ceramic molded is never a panacea. Without some good RF dielectric loss measurement gear you won't be able to know if the ceramic mix has strange stuff in it

that could result in it being a lossy dielectric. Some ceramic
coffee mugs can heat up by themselves due to trace-whatevers
fired in with the ceramic. That indicates a dielectric loss at 2.4
GHz...but you won't know what the effect is at lower RF without
measuring it.

I would say you have a needless worry on former material. If you
want to fire your own ceramics, go for it! :-)

A 10MHz oscillator in a sealed metal can could be a TCXO
or possibly even an OCXO.

Has it a similar pinout to the unit at the bottom of
this page?

Sounds like a Direct-Conversion Rx./Tx. set-up to me. Where the Local Oscillator is the same as the Rx/Tx Frequency. The ICOM751 should normally be Zero-Beated to the signal in SSB Mode. But using Incremental Tune to set the Side-Tone in CW Mode else you would end up chasing a CW. signal up and down the band. The other source of the problem might be RF leakage from an unshielded Tiny Tornado, radiating back through the Rx Rf stage ! This was how German Submarines were detected, even during "Radio Silence" in WW2. They were leaking the LO (Rx +/- IF) back to the antenna in the RX mode. This was Cured by an extra RF stage between the antenna and the first mixer. This is how unlicensed TV sets were detected in Great Britain, BC (before Cable).

Andy writes:
  Jeff, I haven't tried this method, but one rule of thumb I have
always
believed in is:

"No matter how much you shift, limit, amplify or divide noise, it still
ends up as noise"

  The only effective way I have ever found is to narrow the bandwidth
around the signal until the signal starts to get degraded. If done
digitally, it can be done by digital processing, but that changes only
the technique, not the principle...

   So, while I would really like to try out some of these "improved
methods",
I am not confident enough in them to spend a weekend wiring together
some hardware.... In my younger years, I probly would've, tho....

   Personally, as a CW operator of some 45 years, I have found that my
ears/brain does a lot better job of filtering than one would suppose,
especially
~~~~~~

if I am copying some standard message where I sort of know the words
the other fellow will send. I only need 2 or 3 letters per word to
fill in
the pieces with devastating accuracy (grin).....

But, good luck on your efforts. If you do build up something, please

come back and post it here.   I am sure that there are many
experimenters who try something like that if someone thinks it shows
promise..... But, please, take some actual measurements. And with
S/N ratios of around the 0 db level. My ear copy can still pick those

out, and many of the "processors" can't deal with noisy sigs in that
region....they tend to fall apart when anything below tangential
sensitivity is received....

Andy   W4OAH in Eureka, Texas

Actually, digital processing CAN change the principle.

FIR filters and similar digital filters do provide a way to reduce the bandwidth digitally, and as you point out, reducing the bandwidth reduces the noise. This helps the same way a crystal filter helps, except perhaps giving a little more flexibility.

However, many modern radios have digital noise reduction which is quite a different animal. With digital noise reduction, the incoming signal is analyzed to identify noise components and differentiate them from signal components. The noise is then subtracted from the signal. While this isn't perfect, it can result in quite a substantial reduction in noise without reducing bandwidth.

The combination of bandwidth reduction and digital noise reduction can greatly improve readability.

I agree that other typical analog techniques don't really affect things all that much, but I'm not convinced that the same techniques that are used for noise reduction digitally couldn't be duplicated with analog components; I've just never seen it done, and without some considerable creativity on the part of the designer it will be quite complex.

One analog behavior I have noticed that helps, at least with CW. For passive balanced mixers, there is a diode threshold voltage required for the signal to be detected. If the gain is managed so that the noise level is very close to this threshold, the signal to noise ratio seems to be improved (although I have not personally validated this analytically). Of course, if the signal is at the noise level this doesn't help, and if the signal is barely above the noise level the adjustment is too critical to be a great help, but where the signal has enough headroom, it can pretty dramatically improve the pleasure of listening to a weak signal.

GAWD, These kids nowadays have it made!
Check out this kewl hotwheels radar gun on sale for $20.00 at Walmart.
I wonder if it's accurate though, I might just pick one up and
dissect it!!
Anyone already get one of these, is it accurate? TIA

Never mind, it worked the third time.

Joe -

I went to my files and found the EC3000/EC4000 Tech Sheet (I have not yet
posted this one).
This model had the slide switch between READ and SET.

It shows an ICL 7137 as the main display IC and a MOG 2374 as the control
board IC.

The resistor values on the display board are critical for proper F readings

Double check the voltage on the secondary of your transformer. Red 24 VAC, Blue 9 VAC and Yellow - Common. On SOME models, like the EC3000 and EC4000 series a 1 ohm resistor is placed in series with the BLUE wire usually just inside the transformer (wrap/solder joint with wire lead).

I did have one -- where that resistor "opened" -- that caused similar problems. The 9 VAC feeds both the +5 and -5 VDC voltages using 1N4004 diodes and 3.9 Kohm dropping resistor on negative 5 and 7805 for positive 5 VDC.

Walmart.com is temporarily unavailable due to high traffic volume. We appreciate your patience. Please check back shortly to see our great values.

Gawd, now I have to go to the store to pick one up :(

And how high can it record speed?  I'd like to try and nail a few
pimple-faced, pill-popping, high school dropouts who thinks 25MPH
speed limit means it's OK to rip down the road at 75.  If it's
accurate enough, a video camera recording the speed and the offending
vehicle with its license place would stop them hopefully before they
get a new hood ornament in the form of a 3 year old child.

I suspect its readout is scaled to Hotwheels scale, not
actual speed.

Nope, it does "real speed" the amazon review says;

Amazon.com Review
Ever wonder just how fast you get your favorite Hot Wheels car to go? Or how
speedy you are on your own bike? You don�t need to be pulled over by a cop to
find out. The Hot Wheels Radar Gun does the job for you, using all sorts of
state-of-the-art technology. Just set the scale to 1/64th or real speed, and MPH

or KPH, aim the gun at objects coming toward you or moving away, squeeze the trigger, and check out the digital readout. Simple as that! Now you can set new speed goals, and actually find out if you�ve attained them. The 1/64th scale speed reflects the fact that Hot Wheels cars are 1/64th the size of a real car. So if a Hot Wheels car goes 10 MPH, the calculation is 10 MPH X 64 = 640 MPH! Now we begin to understand why those wheels are so hot! Requires four "AAA" batteries (not included).--Emilie Coulter

Product Description
Now you can read the speed of your favorite Hot Wheels racing vehicles. With point-and-read real-life styling and super-cool graphics. Not for use with some Hot Wheels vehicles. Requires 4 AAA batteries- not included.

On the box it claims it does actual speeds up to 100 MPH. It's a hot item on
EBAY, but you can get it cheaper at Walmart or Amazon, the sell it on ebay! ;)

Interesting. Someone must be out there flogging a set of components
for radar guns. I bought a Bushnell one for measuring baseball speed
for < $100 not too long ago. It seems to agree fairly well (within a
couple MPH) with the professional models.

Best regards,
Spehro Pefhany

Unit operates on 10.525 Ghz and has a range of 39 (Thirty Nine) Feet....

Now for the laugh of the day. I was in the local Office Depot and saw a
pair of GMRS/FRS Ht's on the shelf. The package claimed 14 (Fourteen)
Miles range on GMRS High Power....

That is correct! It uses a 10.525GHz DRO circuitry.
Someone took it apart and posted the photos on the web.

Hmmm... since it is the same as x-band, I wonder if I used those on
freeway, maybe I could scare a few lead foots who has radar detector?
Say I'm coasting down the expressway at posted speed limit when
someone zips past me as if the driver's pants were on fire.  Pick up
the toy gun and zap the offending car.  If the driver has radar
detector on, he'd panic and slow down a bit.

Very easy to build a gunn diode oscillator and scare the pants off
leadfoot at a 5+ mile range.

You need a gunn diode, 8 volt regulated supply, one small bypass cap
and copper end cap pipe fitting and piece of copper/ and some brass
screws to make a mount for the diode.

If you have an old radar detector with good gunn oscillator it can
also make a good X band source for triggering radar detectors - just
isolate the diode/horn sub assembly (you don't need the other parts
just the gunn diode, cavity, bypass cap and power supply). Tune the
cavity screws for maximum effect.

A video camera with on screen timer and known distance markers could do the same thing - poor man's Vascar system . . .

Then you'd only have to fight the bureaucracy to make a citizens arrest stick . . . or just convince the local TV station to take up your cause - that would probably be a lot easier than dealing directly with government.

Soldering Station

Hi
I am trying to fil my Weller soldering station which has lost its
temperature readout. This particular model has the Intersil
CA3162E/CA3161E A/D and BCD/7Segment chips. When first turned on the
display flashes "EEE" and then goes blank. I shotgunned the repair by
replacing the filter caps in the power supply and though I had it fixed
but it is back to same problem.

In reading the Intersil application notes for the A/D convertor I don't
see  a logical  mode where EEE would be displayed
Does anyone have advice for troubleshooting this configuration?

Double check the voltage on the secondary of your transformer.  Red 24 VAC,
Blue 9 VAC and Yellow - Common.  On SOME models, like the EC3000 and EC4000
series a 1 ohm resistor is placed in series with the BLUE wire usually just
inside the transformer (wrap/solder joint with wire lead).

I did have one -- where that resistor "opened" -- that caused similar
problems.  The 9 VAC feeds both the +5 and -5 VDC voltages using 1N4004
diodes and 3.9 Kohm dropping resistor on negative 5 and 7805 for positive 5
VDC.

Pete

Thanks for the tip on the ARM button now I'm getting closer to what I
know...
Next I've got figure out what all the FFT is about.
Hank

FYI

I just got my eBay CD with the ops and service manual and first glance tells
me that it has what I need. It's 202 pages and much more comprehensive than
the Agilent download and has examples on how to use it.
Thanks to all who tried to help me.

Can you be a bit more specific? I found a two-channel "Ground Loop
Isolator," #270-054. Is that what you're talking about? I didn't find
much else in the way of aurio isolation transformers there. From one
of the reviews, it sounds like the frequency response may not be all
that good; there are no specs on the web site (that I could find) that
tell us what the response or distortion is.

Cheers,
Tom

Your CB radio not back from the repair shop so you got to attack real
radio operators?   I knew you went for those "easy-to-burn-up' Cobra and
Galaxy brand appliances.

Oh, and I don't live in colorado, I'm ya alls next door neighbor.

Howdy Neighbor. Heee Heee Heeeeeeee!

I have a 430 and there is no power output. Receiver works fine. Don't know if it is the finals or the power management circuit. I have used the rig for several years and many hours of use. I was using Groton Electronics for repair but they went out of business. Does anyone know of a reliable place that will work on the Kenwood 430s.
Thanks

There is a TS-430 Yahoo group. Ask there. No power out can be caused by
many things, one of them is a bad connection easily fixed.

Geoff.

Yeah, but I bet that there are hundreds or thousands of times more parts sold
on eBay than eHam & QTH combined... (and of course eBay isn't free) -- There's

```
definite value in a large selection and easy search/sorting functionality.

If you look at the web page where they tore it apart, you'll see it's little more than a microwave transistor oscillator using a DRO, another transistor for the mix, and a PIC microcontroller for all the "smarts." The PCB itself is a pair of (planar) antennas for Tx and Rx.

Clever idea... I wouldn't be surprised if someone thought it up and realized they'd make a lot more money selling the design (and consulting on it) to toy copmanies than just publishing it in, e.g., QEX.

I work in a screening lab and have these 1:1 xmission line xformers:
http://www.futureelectronics.com/wirelessrf/docs/ETC1-1-13.pdf

I need to measure their insertion loss, per spec to 3 GHz. But I've never used one before and am not sure how to connect it.
I connected it as shown in this tutorial:
http://www.bytemark.com/products/tlttheory.htm
using an HP8753D in CW mode as a source and an HP power meter across the outputs as RL. Does that seems ok? I'm not sure about using the power meter across the output. Should I load one output and connect the power meter to the other, then measure insertion loss? Then switch load an p.m. and I would check amplitude balance also?

My problem is after "cal'ing out" my fixture, I get a bad dip in the insertion loss around 2GHz, like there's parallel C across the 'inductor' and it's resonating and opening up.

I made a short fixture on regular copper clad with 1/8inch wide traces for 50 ohm, short runs anyway, with SMAs in and out. Using the HP8753 in CW and a power meter, I took reference readings it with copper foil across where the DUT would be, then put in a DUT and took readings.

Good service, did take some time, about 3 weeks, but the results were worth the
wait.

Usual disclaimer, not connected, just a satisfied customer.

Many amps produced today use ferrite in the tank (usually toroids) for 160/80 meters... This is done to keep the physical size of the tank compartment minimized... Skipp has pointed out the drawback... You cannot saturate an air coil...

------------ REPLY FOLLOWS ------------

I could be wrong, but I don't think you will find ferrite coils in the
tank circuit of any commercially built amps. Powdered iron is
preferred for resonant circuits because it will not saturate at any
reasonable power level, unlike ferrites.

You will find ferrites in non resonant circuits such as filament or heater chokes.

Wouldn't that also drastically reduce the Q of the tank?

16-bit NICs are $10 apiece, and likely free for the asking from almost any office's dead PC junk heap.

> Besides, there's always the fun of doing it, and that much time

Seems to me your time would be better spent on things with lasting value.

Linux is free. You can boot directly off the CD image. CD drives are less than $20 new; likely free for the asking from the dead PC junk heap. Any pre-built kernel less than 5 years old will work with most NICs, PC filesystems, and CD drives. Total time and cost can be less than the kW-hrs you already burned musing about parallel port transfers.

I bought two brand new Airlink NICs for $0.99 each from Fry's
Electronics a few months ago. How could I not pass up a bargain like that?

Bob

Simply using google to find a laplink parallel cable is quick, too.

Hi, I'm looking for a Collins 30L-1 Round Emblem, High Frequency, Linear
Amplifer. Not looking for any junk, actually I want one in excellent
condition, Must be Round Emblem... Prefer one that has already been
refurbished, things such as power supply, caps , etc...So as I do not have
to do it...Although I've restored a few of them...I just want one in
Excellent to Mint Condition...
If anyone out there has one of these amps, please feel free to e-mail me and
if you like call 718-331-7427

Thanks a Lot
Carl

Well, of course you are right that the high permeability stuff in the
tank is iron not ferrite...

Cut me some slack - I'm old enough to be your grandfather, I didn't
have my nap, and that cute little nurse they send out to watch me has a
habit of bending waaay over, which instantly diverts blood flow from
the brain...

If the preceding stage is clean, does it matter? The main point of the tank
is impedance matching. If the stage before isn't too clean it can also
double as a filter, but if the input to the tank is pretty clean, then the Q

```
doesn't really matter all that much.  Indeed, lower Q is an advantage in
terms of being able to operate across the band without retuning.

..

What you say is true only for class A operation. In any other class,
the plate tank acts as a "flywheel" to provide the missing portion of

the RF cycle, and in that application, Q is important. If the Q is too low, the "flywheel" runs out of energy and severe distortion can result. A Q of at least 10 is recommended for that reason, and Q's of 12-15 are often used for better harmonic suppression. Q's above about 20 are a bit much and can lead to excessive heating of the tank coil and a narrow tuning bandwidth, but are otherwise pretty much harmless.

>Seems to me your time would be better spent on things with lasting value.
>Linux is free....

Linux may be free, but the aftermath of installing Linux would cost YEARS of effort to "port" the:
  801 FORTRAN programs I currently use
  225 Pascal programs I currently use
  452 DOS .BAT and Norton's DOS .BTM scripts I currently use.

No, converting to Linux is NOT free, especially at my age!

>Simply using google to find a laplink parallel cable is quick, too.
>http://www.nullmodem.com/LapLink.htm

Of course, even LapLink's "parallel" cable only transfers 4 bits at a time vs. the 8-bits that are possible on an EPP port.

And LapLink does NOT run in the background (as does RIFS - Remote Installable File Server, which, alas, uses a serial port and is thus also much slower than a fully parallel port.)

I find it interesting: lots of people have suggested I do something ELSE, but no one has answered the question itself. Obviously I posted my question in the wrong newsgroups! Oh, well; nothing ventured, nothing gained (and only a little time lost).

NICs work fine in DOS. At least back with Windows NT (and probably still 2000... possibly not XP anymore though) you could tell it to build you a "DOS startup disk" which configured most everything you needed to connect to a NetBEUI-based server (which is still supported in XP, etc.). Many network cards still come with DOS drivers, and of those that don't, many really cheap ones are still "NE2000 compatible" and generic drivers can be found. I'm sure you can Google for the details -- I haven't done this in a number of years, but very commonly what I used to do was make DOS network startup disks so that I could connect to a server to pull over a complete hard drive image to set up the machine using, e.g., Norton Ghost.

There's a very good chance the vast majority of your programs would work under WINE in Linux. That being said, Linux -- especially with the "popular" desktops such as KDE -- has gotten to the point of requiring powerful enough hardware that, if your PCs wouldn't "comfortably" run at least Windows 2000, you probably shouldn't bother with Linux as you probably won't have a pleasant experience if you just perform a "default" install of any contemporary distributions.

You might be better off in one of the "historical" computer groups (maybe alt.folklore.computers); what you're wanting to do requires knowledge that's simply obsolete by current standards, so you won't find that many people who still possess it.

I did this back in 1984 when I got a Toshiba portable with the new 3" floppies, just to get files back and forth.
Later somebody made some commercial products (pdq, lablink, ...)

In short I did:

Server end is a program that reads requeste from other pc, and reads or writes disk sectors.

Client side has a device driver, disk type, so I now has a D: on that computer.
I took the memdisk example from the tech books, and rewrote the read and write sectors to go to other computer.

It works very nice. Only trashed a few disks when doing small programming mistakes ;-)

Now the interface between the pc's, which first was tested for function of rx/tx, like Send512Bytes(SomeData)

I had the old parallelport, so I had 5 bits and used 4 for data and 1 for strobe.
I did not use interrupts, as the server just sat there waiting for the other end to start flipping the strobe bit.

```
Procedure SendHalfByte(Strobe,B: Byte);
begin
  Port():= Strobe+ (B and $0F);
  SleepShort;
  Port():= (1 xor Strobe)+ (B and $0F);
  SleepShort;
end;

Procedure Send1Byte(B: Byte);
begin
  SendHalfByte($00,B);
  SendHalfByte($80,B shr 4);
end;
```

The receiver end will do

```
Function Read1Byte: Byte;
var X: Byte;
begin
  repeat until StrobeBit<>0;
  X:=Port() and $0F;
  repeat until StrobeBit=0;
  Result:=X + (Port() shl 4);
end;
```

Use Send1Byte and Read1Byte, and you have data. Make some framing like
`DataToSend:= LF + MyData + CR`
and it is easy to check for correct reception.

I managed to put some 50KBytes between two PC's in 198x, at 8MHz I guess.

PS: All coding above is out of my head, and was done in assembler back then.

You asked how to connect tow parallel ports. The link gives two examples. The examples are ones that worked with commercial software. (Hint: that means they would probably work for you. It may also meet your criteria for reliability.)

>
> And LapLink does NOT run in the background (as does RIFS - Remote
> Installable File Server, which, alas, uses a serial port and is

Your original post made no mention of specific software being a restriction.
It did say this was a one-off job without out a speed requirement.

>
> I find it interesting: lots of people have suggested I do something

The link answered the question in the subject.

> Obviously I
> posted my question in the wrong newsgroups! Oh, well; nothing

Your fault the time was lost. Simple google searches would have given you
what you wanted.

The search to find the earlier link was on "laplink parallel cable".

If you do a search on "connecting epp ports", one of the links will be this
page.

http://www.lvr.com/jansfaq.htm

Scroll down to the bottom to see a problem with connecting all data bits.
(You did say you wanted a reliable solution.)

Yes, this may have been the wrong newsgroup. That is not the fault of anyone
who replied to you.

Wollongong. Beame and Whiteside. To name two.

But that's going backwards. With one foot in the grave already, you need to
keep moving forward, not back. If it runs DOS, it'll run Linux.

It boots off the CD. I know I mentioned that. It's worth mentioning a second time. And a third: It boots off the CD. No installing, no configuring... Just boot it, FTP your files, and get on with whatever it is you're trying to do.

>
> No, converting to Linux is NOT free, especially at my age!

Yeah, I know just what you mean. About the age thing, that is. Time's wasting; best get to it.

Maybe it was the wrong *question*. Kindly refrain from
criticizing a forum like this for not being your personal
research staff.

As the discussion showed, what you really want to do
is transfer files. Fine. If you want to transfer files, a null
modem cable (an off the shelf item) and a couple of
copies of kermit (ditto) will transfer a lot of data. I
transferred a Windows 95 CD to a laptop once that way.

Thanks to all who replied to my query. I have found it is the FET which is
faulty, have a number of spares available. Haven't been able to get to it
yet, my young brother has been visiting, but will start on it this weekend.

That may be what the DISCUSSION showed, but that's NOT what my QUESTION
asked (which was how one might connect two EPP ports so they could "talk"
with each other bidirectionally).
```

```
Others "answered" the question by suggesting alternative solutions
    (And there is/was nothing wrong with that!),
but only a very few actually addressed the original question,

And I hereby thank them.

Bill, there is a transmitter described in the 1967 ARRL handbook
that does indeed have a small piece of 1/2 dia ferrite rod (broken off a
BCB loop stick) inside the 80meter tank coil to decrease the number of
turns needed in the coil. This was a two tube transmitter using a 12by7
and a 1625. Plug in coils are used for the oscillator and final tank
circuits.

```

Sounds like there's some confusion here between "loaded O" and "unloaded Q".

Ferrite in the tank coil reduces the number of turns needed for a given coil inductance but it also reduces the "unloaded Q" of the COIL, increasing tuned circuit losses. The "loaded Q" of the CIRCUIT is primarily what determines bandwidth, and it is determined by the inductive reactance and the load impedance the coil is imbedded in. The inclusion of ferrite has little to do with "loaded Q" and thus little to do with the bandwidth of the circuit (at least for practical first-order considerations; small tuned circuit losses do have a small second-order effect on bandwidth).

So what appliances does everyone hope Santa brings them for Xmas?

HF, VHF, UHF, KENWOOD, YAESU, ICOM, Cobra?

I couldn't think of anything for myself, so I hope I just get a some componants and a new soldering iron for projects so I can keep moving forward in ham radio.

SC

>Ferrite in the tank coil reduces the number of turns needed for a given coil inductance but it also reduces the "unloaded Q" of the COIL, increasing tuned circuit losses.

When reducing the number of turns, the resistive losses would go down, especially if a thicker wire can be used in the same space. Does the ferrite core losses _always_ increase faster than the coil resistive losses are reduced ?

Telstar Electronics wrote:

> . . .
> Not sure I agree with that. What about losses? Lower Q means higher
> losses...

Loss is related to the ratio of unloaded Q to loaded Q. All else being equal, lowering the unloaded Q will increase loss, but lowering the loaded Q will decrease loss. As others have posted, the unloaded Q is a characteristic of the tank circuit itself, usually primarily the inductor; loaded Q is largely dictated by the external load and how it's coupled to the tank. Hence the tendency to keep the inductor Q high but not make the loaded Q any higher than necessary for harmonic and spur reduction.

I'm not certain to which group I should post this question, so I'm shot gunning hoping to find it. If anyone can point me, please do. However....
Has anyone used the HP 3582A audio spectrum analyzer to plot the freq response of audio devices like mikes, speakers, etc. Knowing the mike response I'd like to see the spectrum of plucked guitar strings and their harmonics and see how different manufacturers sound varies in a plot. I got a 3582A at a swap meet, its complex and probably overkill but that's what I have and I am anxious to try it out and would appreciate any tips.
Thanks

The 3582A is just one of many two-channel FFT analyzers which can be used to measure the frequency response of a system (output re input). What specifically is your question? Perhaps all you need is to get an operating manual and learn how to use it?

Spectrum analyzers do a whole lot better with continuous signals than
they do with a plucked guitar string, unless you can capture the audio
and analyze it digitally. If it is an actual FFT that you can use and
you got it cheap enough you may have made a killing in the instrument
department. Why I go to flea markets and especially estate sales where
the widow is running it. About 3 months ago I bought some 30 year old
equipment, brand new in the box from a widow who just wanted to find a
good home for her departed husband's "junk". Tektronix used to have plug
ins for their line of scopes to do just about anything so if you can't
master what you have, check E-bay.

I've done this, some years back, with much more primitive gear. and
found that the spectrum of a plucked guitar string varies with time;

ditto for the natural and left-hand-stopped harmonics. If you listen closely, you can _hear_ the variation: the higher frequencies die much more quickly.

I'm not sure of the physical mechanisms that are involved, but suspect that they include the nonlinearities in the strings, the woods. The shape of the soundbox probably has a strong influence as well, or so I think. I would not be at all amazed to find that this holds true for plucked chordophones in general.

I would expect the spectrum of a continuously-driven string -- a bowed string, such as a violin, viola, violoncello, viol, or vielle string, OTOH -- to have a spectrum that was closer to time-invariant, once the string got up to constant amplitude and as long as the bowing continued. A hurdy-gurdy wheel is the ideal here, since it acts as a bow as long as it is being turned.

But you're wanting the response of a plucked string, not that of a bowed string. I suppose you could try two different approaches. One of them would be to build a rotating-wheel bowing machine to look at the spectra of strings continuously-bowed with different speeds, at various distances from the bridge, and at different pressures. Another would be to build a mechanical string-plucker, so that you could get consistent values of plucking force, while (again) varying force, distance from the bridge, and so on.

An advantage of the mechanical plucking machine would be that you would (should, in a perfect world) be able to use the output of multiple runs where all the variables were the same, and that you could build some very nice "3-d" plots to show the variation in spectra as the distance from the bridge (or the force, or some other variable) changed.

Still, it is an interesting project -- the more so to me since I've been a classical guitarist for 49 years, and learned that strings from different manufacturers, and even different styles of string from the same manufacturer, can sound *very* different on the same instrument. That was why Segovia standardized on Augustine strings -- or so he told us one night, at a meeting of the Houston Classical Guitar Society, back around 1965.

Unfortunately, the same strings can sound very different on two or three different instruments, too. None of this is in any way easy.

This probably would get a fair amount of interest in, say, rec.music.makers.

Posted to, and followups set to, rec.radio.amateur.homebrew, where I read it.

Another option, FWIW, is to use the PC to capture and analyze. The audible spectrum would seem to be quite unchallenging for common desktops. Compression schemes such as MP3 and WMA, after all, operate on the frequency domain. In fact, Windows Media Player delivers the FFT stream to visualization modules. There's likely free software somewhere that can do what you're looking to do. OTOH, you then have the soundcard's non-linearities to deal with, which is likely not on par with lab or even studio grade equipment.

There are studio grade PC audio interfaces, and some are among the
highest-performing audio components around. Some are on a par with the very
best lab equipment.

There is free PC software called RMAA that will automatically conduct a
representative suite of audio tests, and produce reports in a few minutes:

Yes, lots of people have used HP FFT analyzers for all kinds of things.
There isn't a lot of trickery... they pretty much work.

One thing which you can do with these older analyzers is measure much higher voltages than possible on a sound card FFT, much lower frequencies -- they were used for vibration analysis as well as audio -- they are also very well isolated -- you can find a repro of the manual on EBay for ten bucks.

Easy enough to address. I use a 5K RN50 potentiomenter for the purpose. If I want an accurate voltage measurement of audio, I use a voltmeter.

> much lower frequencies -- they were used for
> vibration analysis as well as audio

Not much difference between most vibrations and what a subwoofer does. If an audio interface is flat within 0.1 dB at 20 Hz, then it is pretty good an octave or two below that!

> -- they are also very well isolated

There is this amazingly good audio isolation transformer at Radio Shack. Sells for under $20 a pair...

> -- you can find a repro of the manual on EBay for ten bucks.

You can find an audio interface that will outperform say a HP 334 for $30. For $200 you're in the same league as some of the older, but not all that old AP stuff.

Actually, pretty much any modern PC audio card will have plenty low enough distortion for the application, and quite likely better than the HP3582. The 3582, is, after all, quite an old instrument. The advent of digital audio changed the whole playing field for audio range ADCs and DACs, as well as support parts like op amps (though codecs as used in most inexpensive PC audio systems don't need additional preams on their inputs anyway). Frequency response at the low end can be an issue; there are many vibrations that are too low in frequency for a sound card to deal with. Think "seismic" and you'll understand. The AC coupling in the HP E1433 is programmable to very low frequencies, as it's actually a feedback control system run through the DSP following the ADC, but most AC coupling will have a 3dB corner frequency around 1Hz, or higher if it's really just for audio. Sound cards may well use codecs whose ADCs have digital AC coupling, as well, and the card may not provide a way to turn that off.

Another package that can be used to do FFTs on captured audio, and to otherwise manipulate the audio file, is the free Scilab package. You can play to your heart's content with math functions on the audio (or on pretty much anything else you can represent numerically), but of course you can get yourself into trouble if you don't understand what you're doing. And along those lines, I'd strongly caution you to not read too much into what Scott wrote, "Yes, lots of people have used HP FFT analyzers for all kinds of things.
There isn't a lot of trickery... they pretty much work." The _analyzers_ may work, but if you don't understand what they do, you may make very bad measurements with them, and you may badly misinterpret the results you see. There are, I believe, HP/Agilent ap notes on making _good_ measurements and properly interpreting the results.
Well, I KNOW there are, though finding them on the web may be a bit of a challenge.

Cheers,
Tom

I've been playing with oscillators a bit here, and I wanted to ask if the way I'm intuitively thinking about the operation of a tapped capacitor tank is the way other people do:

Say we have an inductor L in parallel with tapped capacitors, C1 and C2. If the loaded Q of the tank is reasonably high (say, >10 -- which you'd want for any decent oscillator anyway), we can pretty much ignore the "input" and "output" of the tank, as their effect on what happens within the tank isn't significant. As such, we can just look at the current circulating around the tank, and from the "top" of the tank to the "bottom" you get 90 degrees phase shift going from C1 to ground and then another 90 degrees from ground through C2. Hence, from the top to the bottom you have 180 degrees of phase shift, with the values (ratios) of C1/C2 just setting the magnitude of the output voltage vs. the input. Sound good?

I started going through the math involved and determined that you can readily confuse yourself if you don't make the "high Q" assumption. For instance, something like a 1 ohm source and 1 ohm load feeding a tank of 159.2mH (j1 ohms) and 2 318.3mF caps (-j/2 ohms) has such a horribly low Q that there isn't a 180 degree phase shift top to bottom, nor is the resonant frequency 1Hz.

Thanks,
---Joel Kolstad

Sorry, no. EH antenna inventors and apologists notwithstanding, the
phase of current doesn't change as it goes through a capacitor.

Agreed. I'm being rather loose in my terminology here, what I mean by "you get 90 degrees of phase shift going through the capacitor" is that the voltage across the capacitor ends up (must be) 90 degrees out of phase with respect to the reference current as you consider the capacitor's effect.

You don't disagree that the voltage at the top of a tapped capacitor L-C tank is 180 degrees out of phase what that at the bottom at resonance, do you?

Subject: Intersil CA3162E/CA3161E A/D BCD/7Segment problem Weller
Soldering Station

Hi
I am trying to fil my Weller soldering station which has lost its
temperature readout. This particular model has the Intersil
CA3162E/CA3161E A/D and BCD/7Segment chips. When first turned on the
display flashes "EEE" and then goes blank. I shotgunned the repair by
replacing the filter caps in the power supply and though I had it fixed
but it is back to same problem.

In reading the Intersil application notes for the A/D convertor I don't
see a logical mode where EEE would be displayed

Does anyone have advice for troubleshooting this configuration?

> is 180 degrees out of phase what that at the bottom at resonance, do you?
>
> ---Joel

Joel, what do you mean by "at the top" and "at the bottom"? Voltage measured with respect to what point? Clearly, if there is the same current through two capacitors in series, the voltages across each of them must be in phase, so the total voltage across the two is the simple arithmetic sum of the voltage across each. That assumes that they are ideal capacitors, but practical ones will come close. On the other hand, the currents in the two may not be exactly in phase, as you perhaps discovered with your low-Q tank. If the current at the node between the capacitors is contributed to by some external load or source, and if that additional current is not small compared with the tank's circulating current, then the capacitor currents may not be in phase, and the voltages then would also not be in phase, and you'd need to add them vectorially to get the right result.

Of course, Spice will simulate all this for you very nicely, using either a transient analysis, or a frequency-domain analysis if all the parts can be assumed to behave linearly.

Cheers,
Tom

Joe -

Which model are you trying to repair? EC 2002M ?

Positive your handpiece is okay? (Type-K thermocouple can go bad)

Bob Wurth just happens to have replacement control board
on eBay -- item number: 270057328135

reasonable price

Greg

It is an EC2002A from way back. A nice clean unit except for the display
problem. I dug into it this weekend hoping it was just a bad capacitor
in the PS. It did start to work for a short time. There are numerous
potentiometers in the thing, its possible one is intermittent.

Andy writes
  I'll second that.   J  , try your ideas out on SPICE.  Try to figure
out
what it will do before you simulate it, and then use the simulation to
check your conclusions.....  I've found it to be invaluable in
straightening
me out on some of the ways I "thought" nature worked, and in getting
a lot of things straight.....

   Same with EZNEC, if you have it.......  I learned a lot more about
how
antennae really work from EZNEC than in 30 years of cutting wires and
hooking up SWR meters......

  Simulators are wonderful things.  And no one has to know about the
times one turns out to be wrr...wrrro....wr.r...........
imprecise....

                   Andy  W4OAH

I would add: To high the Q and you wan't be able to modulate it anymore (AM,
FM, etc).

Made an inductance meter based on a resonant LC circuit and used a PIC to
back calculate the inductance and Q values based on known F and C and
currents. Circuit was able to work down to Q values of <1 at frequencies
down to 5Hz. Worked well.
Did the programming and found it just wouldn't calculate the correct L
values when working at low Q. Spent hours doing tests until it dawned on me
that I'd stupidly programmed in the "standard" resonance formula.
Suddenly became sweetness and light when I reprogrammed for ...
Frequency= 1/2*pi * sqrt(1/LC -R^2/L^2).
I continue to live and learn :)

```

Ya know, I built an 80/40 similar transmitter back in 1960 and used a chunk of ferrite from a BC radio loop antenna inside the 80 coil form to resonate it on 80 meters - the ferrite was moved around until the tank made the best power out on an RF ammeter then it was glued in that position... A tube VTVM from Heathkit was used to help build the transmitter - and the kit SWL receiver from Lafayette Radio which received the entire ham band with the dial at one setting :)
Lots of bean soup and 'day old' bread from the bakery...Good memories...

I think that is why I subconciously posted the word ferrite when commenting about the current trend to toroids in the tank circuit...

denny / k8do

73, Bill W6WRT

> Bill, there is a transmitter described in the 1967 ARRL handbook

------------ REPLY FOLLOWS ------------

It isn't a question of "Q", it's a question of whether the ferrite
goes into saturation on current peaks. If it does not, then all is ok
but if it does, severe distortion of the RF waveform will occur and
harmonic generation will be excessive. Powdered iron is a much better
choice for this application.

Hi, Everybody,

Over the past couple of years several AM broadcast stations in the L.A. area have begun transmitting the new "HD Radio" signal. A "high quality" digital signal is superimposed on the standard AM signal and so the station can be received with either type of receiver. I believe there are about ten stations now doing this here in L.A. and probably everywhere else in the country.

Have you tried this?: Tune in a local HD AM broadcast station on your general coverage receiver in SSB mode, either USB or LSB. When you zero beat the station you will hear a loud rushing noise floor behind the program audio. This morning, Rush Limbaugh and Dan Patrick sounded like they were each doing their shows from in front of Niagara Falls.

Even in AM mode, as you approach the station from either direction you'll hear a hideous broadband noise until you get onto channel center. It's really annoying and bad for AM DXing because of the interference (in the form of increased noise floor) these local stations cause to the weak DX ones on either side of them.

Al W6LX

Thanks,  I'll pass that on to U-Know-Who, but he probably don't have word,
just computer games.

SC

Bill,

What you say is very true, but the context the clip was taken from had nothing to do with distortion, it was about Q and bandwidth.

Joe

ANNOUNCING the SALE of INTERNATIONAL RADIO
http://www.qth.com/inrad/

George, W2VJN and Georgia are pleased to announce that effective January 1st, 2007 International Radio will be under new ownership. We wish to thank our many customers for their business and friendship over the almost ten years we have owned this company. We have learned much and worked hard, and it has all been good, but it is time for us to look ahead.

International Radio will be in the very capable hands of new owners Trey, N5KO, and Mark, AG9A. Trey and Mark are dedicated radio amateurs who appreciate all aspects of this hobby - especially contesting! They have ideas for the future, and they will not only sustain Inrad; they will improve it. We look forward to helping them succeed in any way we can. In particular, George will stay involved in the development of new products.

For more than two years we have been assisted by Laurie, our employee extraordinaire. Many of you know her and we know you join us in thanking her for her hard work and dedication. We will keep her as a valued friend.

Our final day in business will be December 15th, 2006. International Radio will then be CLOSED until January 1st, 2007. Online orders will be gladly accepted during this time and fulfilled when we reopen in January. Watch the website for the announcement of the annual New Year's Day Sale.

George, W2VJN

------------ REPLY FOLLOWS ------------

If you go clear back to the original question you will see this:

" Many amps produced today use ferrite in the tank (usually toroids) for 160/80 meters..."

My response was that the toroids were almost certainly powdered iron, not ferrite. All the stuff about Q and bandwidth came much later. I stand by my original statement: powdered iron, not ferrite, and the reasons have EVERYTHING to do with distortion.

Bill, W6WRT

Well, looks like most sensible people have your posts blocked, other than myself and the uninitiated... so they never see your posts to reply.

Me, I still find your idiocy to be somewhat entertaining... but in time, I too shall tire of it and decide to "clean up my boards".

Pete
I saw it and got it several days ago but I sure can't make the thing work
like a spectrrum analyzer. And I know how to use a HP 141T and its plugins!
I don't think there's anything wrong with it as it behaves per the manual
Any other help appreciated. Perhaps someone has used one for music study as

I want to.

5 Radio Frequency Interference Ferrite (RFI) Reducers for Round Cables

Cut down on RFI (radio frequency interference) with this effective and easy to use clamp-type split ferrite choke core. Simply snap it over any coax cable, AC or audio cord.

Features/Specifications: Split ferrite RFI reducer for round cables
Clamp-type fitting
Uses high-performance ferrites (Nickel-Zinc) that reduce high frequency noise
Split ferrite assembly are fully enclosed in a Nylon case
Can be installed before or after product setup and assembly

Package Includes: RFI reducer for round cables

Product Requirements:
Suitable round cable

RFI filters can be pretty important when cables are run through big bundles of other cables or near strong power supplies. Put this RFI reducer on your round coax, AC, or audio cord to improve the signal quality. This Radio Frequency Interference Reducer is made with high-performance ferrites (Nickel-Zinc) to ensure a better filter process. It is small, only 1.2 inches long and snaps on in an instant. Here is a picture of the product in use:

Hi Hank,

This unit should operate like any other spectrum analyzer. Make sure that you have it for recursive operation. This button is just above the "ARM" button.
It took me a little while to figure mine out too.

Pete

A lot of liberals and retards have me killfiled already.  I won't truely
be happy until I'm in your killfile too, then I think we'll have about all
of the liberals and retards covered and I won't have to worry about seeing
retarded follow-ups.

A typical ad on rec.radio.swap is free! As is www.eham.net and
www.qth.com

It's not a bad idea, but I'd suggest you aim toward another market.
Ham radio ain't it.

Bill, W6WRT

An even better solution would be to cobble the destination drive
into the source-drive's PC, do a big XCOPY, and uncobble it.
Unfortunately, in my situation the drives are NOT compatible, either.

Neither do the computers I'm working with have Ethernet or USB.

And there's almost a times-100 ratio in speed; to copy a 1 gig
disk via laplink will take about 24 HOURS vs about 17 MINUTES via
the parallel port.

Besides, there's always the fun of doing it, and that much time
difference should even "pay" for the programming effort.

At least one version of laplink that I remember used the printer port for connecting.

Along a similar vein, there was talk in comp.os.cpm a couple of weeks ago about a utility that allowed a dos machine to function as a disk drive for a cp/m computer via the printer port, perhaps if you look that one up, you can write a util that allows your machine to do the same. At least it should help get you started.

In my opinion writing the utils to do it will take more than 24 hours, if you start the copy now it might just be done before you finish writing the utils.

Cross opsys transfers are done here the slow way with some form of xmodem or zmodem at 19.2k, it may take a while but it works just fine while I am asleep.

>
> I've designed saturating RF amplifiers of a few watts output in which the device is on for well over half the cycle, and which have an efficiency of around 90%. The peak-peak collector voltage is nearly 40 volts when run from a 12 volt supply. The high efficiency implies relatively low dissipation in the active device. But perhaps this falls outside some definitions of class C.
>
> Roy Lewallen, W7EL

A flyback switching RF amplifier, Roy? ;-) One can also use active devices that pull hard to ground and to a rail, delivering a square wave output at high efficiency. That square wave can then be filtered with a network that presents a high impedance for harmonics and passes the fundamental, and achieve very high efficiency. A square wave is nice because the even harmonics are theoretically zero, and in practice can be much lower than the odd, so the filter doesn't have to have super-steep cutoff. I guess that would be some variation on class D. It's actually the way the HP8640B generates its signal: divide-by-2 stages from the master oscillator, followed by filters. I suppose it's really best to describe the operation of any amplifier in some detail, and not just rely on "Class A" or the like.

Cheers,
Tom

Cheers,
Tom

Radio Shack - "You've got questions , we've got blank stares". It

seems, as if there is always one idiot clerk and one pushy asshole -
our store, we have this red-headed asshole, who likes to talk-down,
and sell the most expensive of what you want. I am so glad, that the HD
Radio Cartel chose this loser retail chain, as its Big HD Radio Rollout
!

There is no formula for calculating how much you
can exceed the maximum ratings of a component.

I have found that most resistors can withstand several
times their maximum rating for brief periods. A lot
more if you submerge them in oil.

You don't want to do any high power tests while you
are up the tower or on the roof. High power = high
voltage = a long fall if you get a shock!

I got into this a little late, but I'm also assuming in this case that there are no standard, common media (CD, DVD, etc.) either. Somewhere around here I still have a file transfer program which came with a null modem cable, but also gave instructions on how to build a parallel port cable. IIRC, the data lines were 1-to-1, but some control lines were switched. Would this data be helpful or do you already have this information?

I operate mobile with a number of Hamstick antennas - fiberglass rods ~1/2" (1.3cm) diameter with stainless steel whips at the end. A separate antenna is necessary for each band.

The antennas come with paper tags at the bottom indicating which band they're for. These are surprisingly durable, but they aren't perfect. The 20 meter antenna has lost its tag - luckily right now I know that the untagged antenna is 20 but if another one loses its tag I'll be down to comparing lengths of loading coils...

What methods can folks suggest for labeling these antennas? Remember that, while in use, it'll be exposed to the elements on the rear bumper of a car.

You can connect several resistors in a series-parallel combo to get
higher wattage while keeping the 50 ohm resistance. There is a limit as
 a non-resistive complex impedance will grow larger as you add more
resistors due to stray inductance and capacitance. House the resistors
in a small can and fill the can with mineral oil. This will increase
the wattage rating. In fact resistors submerged in oil will handle
10-20 times their wattage rating for short periods. Paint the outside
of the can black to increase radiative cooling.
(Ever see a Heath Cantenna?)

Hint: get 10 120 ohm 2 watt resistors, and connect them in
series-parallel. (IE: 5 sets of 2 series connected resistors in
parallel). This will give you a 48 ohm 20 watt resistor. With the
resistors heat sinked in oil they will handle 200-400 watts for short
periods.

At the time "CB" in the 27mhz region made sense because UHF equipment
was too expensive to build for the masses. That's no longer true. The
FCC should eliminate the 27 mhz CB service before the start of the next
sunspot cycle and force everyone there to move to UHF. One of CB's
biggest problems was interference from 'skip' (DX), and it is illegal to
 work DX stations anyway.

I have to break down the antenna to fit in my trunk. I mark the whip with colored vinyl tape at the point it adjusts into the mast, and put a piece of the same colored tape on the mast. Red=40, Blue=30, Yellow=20. I use Hustlers for 75/80 since the Hamstick doesn't cover 80, and the 75 meter resonator carries red tape so I can quickly tell it from 80.

..

"Doug Smith W9WI" <w9wi@invalid.invalid> wrote in message
news:4555F1CD.5030809@invalid.invalid...

>I operate mobile with a number of Hamstick antennas - fiberglass rods ~1/2" (1.3cm) diameter with stainless steel whips at the end. A separate antenna is necessary for each band.
>
> The antennas come with paper tags at the bottom indicating which band they're for. These are surprisingly durable, but they aren't perfect. The 20 meter antenna has lost its tag - luckily right now I know that the untagged antenna is 20 but if another one loses its tag I'll be down to comparing lengths of loading coils...
>
> What methods can folks suggest for labeling these antennas? Remember that, while in use, it'll be exposed to the elements on the rear bumper of a car.

Your plan will eliminate QRM. There will be nobody left with a
license.

Are you an undercover agent for some commercial group that is looking
to take over ham band spectrum for commercial uses?

You are a caricature of a crusty old fool.

I have a Racal-Dana F64 function generator that I'm trying to repair
for a friend. It has the ability to function as a frequency counter
for an external input, this appears to work without difficulty. I have
not, however, been able to make it generate a signal. When switched to
input, the frequency display reads zero. Does anyone know where I can
a schematic for this machine? Any help is greatly appreciated.

Heatshrink tubing. Either colour coded, or clear with a printed/coded label inside.

How about labelling the antenna or base with a self-adhesive label
(e.g Brother P-Touch), and then covering it with some clear
heat-shrink tubing?

Here's my latest story;

I sent the following letter to;
customerservice@radioshack.com

Hi,
Do you have a service manual (schematic) for Model # 15-1937
Accurian HomePlug Digital Audio Receiver/Amplifier?

Thank you,
Mike

And I received;

Dear Valued Customer, Thank you for contacting RadioShack.com Order Center. Your questions and concerns are important to us and we are dedicated to assisting you in anyway possible. In order to assist you in the most efficient and timely manner, all email correspondence must be submitted through our online email form. To locate our online email form, we ask that you visit our Help Desk at RadioShack.com Order Center/helpdesk and choose Contact Us under Online Store Information. Then, choose the subject that will address your question and send us an email through our online email form. We apologize for any inconvenience this may cause you. Sincerely,
RadioShack.com Order Center

Thank you,
Mike Knowlton

So I think I did something wrong, I check your email and copy
RadioShack.com Order Center/helpdesk
from your email, add www. and of course, there is no such page.
Ok, so I try just www.radioshack.com and look for Order Center/helpdesk
I don't find Order Center/helpdesk anywhere on the page.

After much searching I gave up.
I located an 800 # and called it, After pushing all the right buttons, hey
guess what? I get a busy signal!
The next call, I'm very quiet, I don't say anything to all the prompts,
finally a live person answered and I get switched to someone that
helps me. You don't carry the repair part I needed, but I did get an answer,
it did take two emails and about 45 minutes, but I got an answer.

Your Valued Customer,
Mike Knowlton

I've learned the hard way that P-Touch labels can't tolerate exposure to sunlight.

I like the colored tape idea.

Paint or nail polish with the resistor color code:

GRY/BLK = 80
PUR/GRN = 75
YEL/BLK = 40
ORN/BLK = 30
RED/BLK = 20
BRN/GRN = 15
BRN/BLK = 10

Since the hamsticks themselves are black, you could omit black as the second color unless you want to paint a white background first. I'd paint a circle clear around it like a resistor so you can read it without rotating the antenna.

And yes, there is green nail polish. :-)

Bill, W6WRT

I use standard return address labels under clear heat shrink (teflon) to label pressure transducers at work and it works just fine.

This has to stand up to hot ATF (Automatic Transmission Fluid) at about 100 deg.C.

P Touch labels are thermal and turn black with heat.

Mike KF8FG

So, the way is 2x AD8310 +dual opamp and analog meter.
Will report the result. Now I'm waiting for parts.

Thanks to all

I'm single & live in a small town. Buying green nail polish may not be a good idea<grin>.

Would nail polish stand exposure to the elements?

I've been using nail polish to mark the polarity of toriod coils. The problem is, other than red/pink, most of the colors aren't very opaque. Even though blue and fluorescent green look starkly diferent in the bottle, if you paint them on something dark they are pretty hard to tell from clear. Having the brush in the bottle is terribly convenient, though. Why don't they make model enamel with the brush in the cap? Or nail polish that looks like model paint?

Oh yeah, and nail polish has an amazing range of price. I have a few bottles of the cheap stuff I got years ago. Might be more opaque if I could get my head around ten bucks for a half-ounce of paint.

How's about getting an electric engraver. Sears has them. That would permanently mark them and is 100% guaranteed to be weather proof and probably good up to at least Mach 12 or so :)

At a former job I had a rather over weight supervisor, and there was a
crazy technician from Jamaica.   The tech was always making rude
comments about his overweight boss, so we had "the black calling the
kettle pot".

> Hustlers for 75/80 since the Hamstick doesn't cover 80, and the 75 meter

Yeah, this was an unpleasant surprise last night. I'd bought the 75m antenna months ago & figured it was marketed as "75" because they didn't think anybody would want to work mobile in the CW band. Finally got around to trying it in a Wendy's parking lot in Cadiz, Ky. - and found with the stinger all the way out it wouldn't resonate any lower than 3650.

Yet the cutting guide packed with the antenna provides length settings for the entire 80m band.

Yes, I *was* parked far away from any light poles/buildings/semis/other detuning objects...

(and despite the >9:1 SWR I was able to make three QSOs on 3560 as far away as Pennsylvania...)

What is it about cities?

Here in MI, the Interstares move along quite nicely out away from the cities
(well, except Friday night when everyone in the state goes "up north"), but
get near Detroit or Grand Rapids or Kalamazoo and you better have your jet
pack..

Amen brother! Not only do they have to go faster, but they HAVE to be in FRONT of you, no matter what!. I've been passed like I'm a dirty rag going in reverse and once they pass, then they get in front of me and slow down to exactly the same speed I am going when they pass me. That always makes a bunch of sense to me! Worse yet is when they pass you in town on a two lane road, get back into the lane in FRONT of you (again), go 2 blocks and then put on their LEFT blinker and now we BOTH have to wait for opposing traffic. I suspect THIS is the reason the concealed weapon laws have a hard time getting passed into law ('cause that sucker would be dead now) ;)

I like your reasoning, although realistically they'd have to have a well-publicized program to do so that would most likely have various "deadlines" that would get pushed back a few times before really having any meaning (just as the switch to broadcast HDTV has done!) I'd expect that equipment manufacturers would -- for a time -- be building dual-band radios.

Given how "abused" FRS and GMRS are anyway, perhaps the FCC could just drop the GMRS licensing requirement and pretty much be done with it!

Really -- I didn't know that (the part about it being illegal)! Seems a little silly to me...

indeed it is ilegal to make a contact more than 150 miles away from
you a rule I have broeken without trying near the top of the last
cycle with a a mag mount on AM was living near springfield IL
mentioned the town springfield someone came back refered to roads that
don't exist so yes I have broken that rule and was techinal subjec to
a serve fine becuase the FCC tried to rewrie the laws of physics

it makes it difcult for me to be too critcal of breaking other of the
rules when the rules are so hard to take seriously

I know you're right. Requiring good operators will kill the service.

Hams just want to be appliance operators these days and they don't want
license exams that will interfere with them getting to those appliances
even though it means being less skilled. I don't see anyone modernizing
like everyone says is happening. They just get their licenses and grab a
microphone. What percentage of hams have a computer connected to a
radio? Probably less than 30%. Hams don't want to modernize. Guess we
just have live with inferior operators on the bands from here on out.
Then again, maybe hams shouldn't be required to be knowledgable or have
skills. Requiring skills and knowledge is too old skool. Everything must
be outcome based these days, even licensing. It ain't like we have to
help out in emergencies or anything. It's Quantity, not quality. We need
more hams even if they aren't skilled.

Pwr supply is similar in all: Tektronix 2213/2215/2213A. bama.sbc.edu
as a starting point for free download.

check postings of Jim Yanik and others in sci.electronics.* for this
type of fault.

This type of Tektronix scope has an SMPS with a primary pre-req
circuit. Faults, repair hints and corrections are often described in
e.g. sci.electronics.repair and similar.

Most often: TL597 IC blown, FET blown, fast recorvery diode blown.

hth,
Andreas

This item on ebay:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=200047524644
has a ferrite rods in the tank coil. I've never heard of or seen this
before.
Any expert opinions out there?
tnx

Sure, it's done quite a bit to increase the inductance. The fly in your
soup is trying to keep the ferrite material from Saturation.

If you like the subject of rf (and audio) amplifiers you might consider
joining the yahoo rf amplifiers group:

http://groups.yahoo.com/group/rfamplifiers/

Well over 800 members and we talk about all things rf amplifier related
but not limited to.

Hope to see you there...

cheers,
skipp

I think you will find that cw is making a comeback.   Now that the cw requirement has been serverly reduced, more hams are getting into cw and it should be starting to make a comback....

Second... I also think you will find that the fcc, and in my country the IC, are deeply regretting the conversion of 11 meters to 'cb'. Virtually all of our bad radio operating procedures, of all radio services, can all be traced back to the bad operating technique found in the 11 meter cb band....

CW could make a something of a comeback Like AM if it advocates can
learn better manners bothon here and on the air dealing with newer CW
Ops

as it I I suspect MORSE USE is doomed by the attittude of it's
advocates

How about a DF to give the bearing to the transmitter?

See straws, grasping.

============================
Super glue (cyano-acrylate) works on the basis of 'exclusion of oxygen'
at the joint ,hence it can often be used effectively for rejoining
broken crockery.

With plastic the break surface is often less 'crisp' especially when
interfered with by tools /sandpaper.   Hence an expoxy type of glue is
then more appropriate .

Some plastics can be jointed by hot glue dispensed by a hot melt gun
provided it is done carefully and there is a reasonably large jointing
surface.

Polystyrene can be best (re)jointed with polystyrene glue as used for
model making , or acetone (nail polish remover) when the material at
the joint is dissolved locally by the acetone (a solvent).

Wasn't it 4 watts output?

Some more facts:

11 meters was never a ham band by international treaty. FCC allowed hams to use it on a shared basis with Industrial, Scientific and Medical users after WW2. This was done in part as a sort of compensation for hams' loss of 160 meters to LORAN after WW2.

The Citizens' Radio Service was created by FCC in the late 1940s. The original Class A and Class B services were on UHF - right where FRS and GMRS are now.

The problem was that, in those days, the UHF radios that performed well were big, heavy, expensive, power hungry and complex. Simple UHF sets that were small, light, inexpensive and simple didn't perform too well.

The Citizen's Radio service had so few takers at the end of 10 years that FCC created Class C and Class D, at 27 MHz. Low power channelized sets for 27 MHz could be made small and inexpensive even with the technology of the late 1950s.

FCC could take the band away from hams because it wasn't a ham band by treaty anyway. They also argued that the creation of the 15 meter ham band in 1954, and the gradual return of 160 to hams, meant that 11 meters wasn't critical to ham radio.

Add to that the fact that 11 meters wasn't the most-popular ham band anyway. Many popular rigs of the time didn't even cover the band. It wasn't harmonically related to the other HF/MF ham bands of the era, and in many areas it was full of noise from ISM users like diathermy machines, vacuum formers, etc. Since many other countries didn't allocate 11 meters to hams, there wasn't as much DX to work on 11. And the 1.7 MHz wide 10 meter band was right next door.

Of course hams didn't like losing the band, fearing that it was a harbinger of things to come, but it wasn't. Over the intervening years, we hams got all of 160 back, and three new HF bands at 30, 17 and 12 meters. The cb boom of the '70s came and went, and hams are still here.

John,

If it's not too difficult for your tiny CW hating brain to handle, try to
figured out how to use your killfile. Everyone is tired of seeing your
retard follow-ups to my protect ham radio posts. Tnx.

Try not to get your pants dirty when you sit on the floor at the next
club meeting.

Mac,

You will probably get more responses if you describe what you want in
more detail: frequency of operation, inline or test instrument, self
contained or PC based, remote head, analog or digital display, cost,
commercial or homebrew etc.

I suggest that you take a look at current and back issues of the ARRL
handbook and read the articles @ http://www.arrl.org/tis/tismenu.html

Regards - Roger

As a former user of 11 meters, the Ham Band, this summary pretty much reflects
my memory of events. BTW, my old Multi-Elmac AH-54 [if I recall] had 11 meters
factory installed. It drifted "slighlty" during each transmission. Slightly
meaning 50 +/- KHz. I had to use crystal control to stay reasonably close to any
frequency!

Hi Roy and Mike,

Ten Tec made a device similar to the one Roy is describing back in the 1970's. It was called the S-20 Signalizer and I don't think that Ten Tec sold very many.   I still have mine and use it quite frequently. As Roy said, it was not for weak signal work and most everyone who bought one seemed to think it was just another filter or Q-multiplier that would help dig out weak signals.

On the contrary, the Signalizer works best when you have a strong signal and you just want to get rid of some annoying background sound, like a heterodyne or static crashes. I use mine primarily on 80 meters when there is QRN and I feed its audio to one side of my stereo headphones. The other side of the headphones goes directly to the audio from the receiver so I can hear the raw signal without any AGC action. The advantage of this arrangement is that I can turn the receiver audio down a bit lower than I usually would and still pick up those characters that I would miss completely with the signalizer. It is definitely more comfortable than listening to the raw receiver audio for a long period of time when QRN is present.

Of course, the above arrangement only works because the brain is in fact "an amazing signal processing system", and can selectively insert the weaker signal from the raw receiver audio into the stream of perfect audio coming from the Signalizer.

Mike, I might add that the product review of the Signalizer in QST said that the effect of turning it on was "like closing the door" to shut out the noise from an adjacent room. When I try to describe the effect of the Signalizer to others ("Its a re-keyer, not a filter"), I often use the very analogy that you mentioned, namely that its like being able to lower your voice when someone turns the air conditioner off or other people stop speaking in a crowded room.

You occasionally see a signalizer on e-bay, often misdescribed as a CW filter or amplified speaker. A couple of months ago one went for about fifty dollars as I recall.

I hope not. The FCC providing unlicensed spectrum for the masses was one of the smartest thing they ever did! Yes, it leads to all sorts of horrible operating practices, but CB and -- more contemporarily -- FRS/GMRS and WiFi had provided *huge* benefits for people (and many millions of dollars in equipment sales) nationwide. I'd hate to live in a country where there's no such thing as a license-free $20 pair of FRS-type walkie talkies or $20 WiFi cards for high-speed Internet access.

I'd say they can be traced back to human nature. People were rowdy and "uncouth" in, say, taverns for thousands of years before CB came along.

the bad part about what they did with CB was providing that band for
and limiting it to local comms when everyone knew it was usable for
longer range stuff this insurred folks would not have much respect for
the rules (wether they obeyed em or not

I'll agree with the uncouth in the taverns part, but, disagree with the context.

CB brought the uncouth out of the tavern and onto the air.

I haven't seen a lot of examples out there, but the project seems very simple; perhaps trivially simple.

First, you build a directional coupler -- there are a number of designs out there, but none are especially difficult. Then you rectify the voltage and perhaps amplify it. Feed the two voltages into a microcontroller that does the math and operates the display (digital of course). Analog isn't going to be so popular because you not only need a meter (generally harder to get and expensive these days), but you will need some custom meter face, and what it needs to look like won't be all that obvious.

You can get 10 bits on a microcontroller A/D pretty easily and cheaply, more bits will generally cost more, sometimes a lot more. While you don't need terrific resolution for SWR, you will if you want to measure SWR over a wide range of power levels. A lot of micros have 5 or 10 A/D's, though, so perhaps you could get cute and avoid the need for something expensive.

Not many micros have D/As, but many have PWM outputs that can be filtered and would be plenty enough resolution for an analog meter. The cool part of that is that you could have your retro instrument, and you could adjust the output to match the meter face you have.

Of course, if you aren't afraid of a little work, a graphical LCD could be made to display a meter face .. after all, it's only ones and zeroes <g> Some of these color LCDs from cell phones (pricey) are all the rage among some PIC hobbyists these days.

..

Another possibility along these lines would be a little more analog-ish.

Analog Devices makes a line of neat little "log amp" ICs. Feed them a sample of RF on one pin, and you get out a DC voltage which is proportional to the log of the RF voltage. They have a wide frequency range and if I recall correctly the Vout=log(Vin) relationship holds up pretty well over several decades of power level.

Build two direction couplers, as suggested above, but without the rectifier diodes. The ARRL handbook has instructions for building directional couplers for HF out of copper pipe. For a physically smaller design (for lower power) google around for "stripline directional coupler", "monimatch", and similar terms, or go to the Boat Anchors Archive and hunt around for the manual for an old Heathkit SWR meter.

Take the directionally-coupler-sampled RF signals (forward and reverse) and run them into a pair of the ADC log-amps.

The two DC voltages which come out will be proportional to the logarithms of the forward and reverse voltages. If I remember my math correctly, this means that the difference of the two is proportional to the logarithm of the ratio of the forward and reverse voltages, and would thus be a pretty nice indication of the return loss in dB. Zero voltage difference would mean zero return loss (infinitely high SWR), and the voltage difference would increase with the return loss (lower SWR). The upper limit on the voltage difference will probably be set by the directionality limit of the directional couplers.

Take this voltage difference, run it through a voltage-to-current converter (a.k.a. a series resistor) and into an analog meter, and *bingo* you've got a direct-reading SWR meter. It'll read at the high end of the scale for a 1:1 SWR and will not deflect if the SWR is infinitely high.

It might need to be recalibrated for a proper full-scale deflection at 1:1 on any given frequency, to adjust for the directionality limits of the couplers.

Take a look at the "DEM ABPM" (Down East Microwave All Band Power Meter) at www.downeastmicrowave.com - it's a professionally kitted version of a homebrew product, which uses one of the AD logamps for frequencies from ultrasonic up through UHF, and a less-sensitive-but-higher-frequency Linear Technologies part for frequencies from VHF through microwave. Readout is through a common DC-to-LED-bargraph IC.

```

Drive by the tavern... tune past the CBers? ;-)

I suppose amateur radio is supposed to be more a high-class dining
establishment than a dinner -- suit, tie, and official FCC-approved membership
required --, although these days you wouldn't necessarily know it from
listening to the airwaves.

Hmmm:

You mean you can quickly tell the difference from some self-important,
self-worshiping, self-impressed, carried-away-with-oneself personality
as opposed to one considering himself/herself to being a
student-of-the-world?  And, your final implication being, "This group of
amateurs is full of the former?"

You present a most interesting observation! <in-a-contemplative-state>

You'll get some good ideas from "The Tandem Match - An Accurate Directional Wattmeter" by John Grebenkemper, KA3BLO, in Jan. 1987 QST. See also corrections to the article in Jan. 1988 Technical Correspondence.

I think it depends where you listen...

This past weekend, I was active in the November CW Sweepstakes. Made
over 400 QSOs in 74 sections (all states except Hawaii). Lots of
activity but nothing objectionable at all.

I think one reason for the relative unpopularity of 11 meters with hams
was that the band was not harmonically related to other bands, meaning
crystals bought for 11 were probably not useful on any other ham band.

Hams are still here right up until code is eliminated.

Too many amateurs now don't care if ham radio turns into the local
scarf & barf.

Thank you all for your replies. Tom's treatise on reinforcement was well-taken on this end and is something I am going to try in the future.

The opinion seems to be that Super Glue has not really changed but that plastics have changed into a form not as easily repaired by Super Glue. However, judging from the way Super Glue used to bond my skin vs. how much less so now, I still suspect that a weakening of the formula may have taken place, perhaps in response to a lawsuit by someone who accidentally glued the palm of their hand to the sole of their shoe or something ridiculous like that. Lawyers are continually ruining products and processes for the rest of us as they search for the next target from which to extract punitive damages.

By the way, I never said what kind of failure it was; someone else assumed a fan blade had cracked. Actually, it was one of the supporting struts that had cracked. I am fairly confident that with some reinforcement a crack like this one has a very good chance of being repaired. However, I believe epoxy is better indicated in this particular case as one of the posters pointed out. Epoxy is one tough glue.

Thanks again.

Al

If you're going to be doing the math anyway, analog or digital, and providing some sort of calibration mechanism, you don't need to get too weird about the directional coupler. For HF anyway, almost any old thing will work. It sort of seems a little like black magic. Just stick a couple chunks of wire next to a section of coax with the braid removed and all of a sudden a directional coupler. I think the toriod based couplers are a little more reproduceable, though.

Somebody, maybe even AD, has an RF power chip, too. Not sure of the specifics of it. Might not be too useful for an analog circuit. A lot of the cool chips these days are little bitty thing with lots of legs that you can't hardly see.

DC (coupler) isn't a problem for me. I've made few reflectometers (both
HF and VHF) based on homebrew couplers. I've tested toroids, pcb's and
copper tubes.

I am rather afraid (terribly afraid) about mistakes in my op-amp
mathematics ;-)

Now I'm thinking about ad 8302, 8307 and also (used in my FSM - ad8313)

Thanks to all who responded. I think I'm starting to understand this. LTSpice helps a lot. I set up a class C amp and looked out power dissipated in the transistor vs. power dissipated in the load. The big efficiency gains that come with saturation were very apparent.

To better understand WHY this happens, I set up a spreadsheet that looked at power dissipated in a variable resistor as it swept from .1 ohms to 10 ohms. It had a fixed 10 ohm resistor in series and 10 volts DC across both of them. Yes indeed, the power disspated in the variable resistor drops off dramatically when the resistance (and hence the voltage across it) gets very low. I guess is why this happens in the saturating Class C amp, Right?

But I still have some questions. When we design a Class A amp, the familiar formula Rload = (Vcc-Ve)^2/2Pout allows us to come up with a load value that will prevent the amplifier from saturating. A load of this value will cause the voltage across the transistor (collector to emitter) to vary from zero to twice Vcc. But it won't go into saturation.

Why then do so many of the books (EMRFD, SSDRA, the W1FB books) call for the use of essentially the same formula for the load when selecting a load for Class C amps?   We're no longer worried about staying out of saturation, correct? In fact, we want to saturate. So why the same formula? In fact, it seems to me that if you have a Class C amplifier that is designed with this formula and is operating just below saturation, you can get it to saturate just by increasing the value of the load presented to the collector. Power out and efficiency immediately improves. Linearity, of course, does not.

Thanks, 73 Bill M0HBR

...

In Class A, the active device is conducting the entire cycle, and conducting in proportion to where you are in the cycle. Because of that, you can drive a purely resistive load--that is, a non-resonant load. Class A is used in single-ended broadband linear amplifiers, such as receiver stages, audio amplifiers, scope vertical amplifiers,
...

In Class B, each active device is conducting for half the cycle. If you use a single active device, you need a resonant tank to complete the cycle. You can also have push-pull class B where one device handles output voltages of one polarity, and the other handles output voltages of the other polarity. It is usual to bias the active devices in such a case slightly into class A, so that the nonlinearities right at the half-cycle point can be smoothed over. But class B in a single ended RF amplifier, with a resonant tank at the output, is still capable of linear performance, because you can reduce the conduction during the active half-cycle and reduce the output amplitude in proportion.

In both Class A and Class B, it's possible for the output to peak with the active device having a very low voltage across it, so that the the output peak-to-peak amplitude at that point is still two times the supply voltage, or nearly so, assuming it's a good approximation of a sine wave there. For class A and B amplifiers, though, the output amplitude may be less than that. The efficiency obviously goes toward zero as the output amplitude goes toward zero, since some conduction in the active devices is required to drive any output, and the dissipation in the active device is proportional essentially just to the current at low output swings since the voltage on the device is nearly constant; but the power to the load is proportional to the square of the current.

In Class C, the active device is hard-on for a relatively small fraction of the cycle. It always drives the output to about two times the supply voltage, peak to peak, if it's properly designed for low dissipation in the active device. But a key difference between it and class A is that the active device is conducting essentially no current except when there is only a very low voltage across it. In class A, there's current through the device at all output voltages.

So at full output in all those cases, the peak-to-peak voltage is the same, and for a given output POWER, that tells you what the effective resistive load should be at that point.

(In Class D, the voltage at the output of the active devices swings very quickly between power rails, spending most of the time at one rail or the other, and the output is varied according to the duty cycle of the rectangular waveform there. That waveform is filtered to remove the switching frequency and its harmonics. The result can be a very efficient amplifier. They are becoming common in audio applications these days.)

Clearly there's a bit more to it than that simple explanation, but it's a first approximation that may get you going...

Cheers,
Tom

I've designed saturating RF amplifiers of a few watts output in which
the device is on for well over half the cycle, and which have an
efficiency of around 90%. The peak-peak collector voltage is nearly 40
volts when run from a 12 volt supply. The high efficiency implies
relatively low dissipation in the active device. But perhaps this falls
outside some definitions of class C.

Andy comments:\

Mike,
The comments you have attributed to me in the above post
are in error. You mistakenly copied another's comments and
put my name in front of it....... Not a problem for me,but
I get into enough trouble on my own without having to catch
any hell for other people... (grin)

Andy W4OAH

But if you're just checking transmission lines, wouldn't it make sense
to get by with a small dummy load, and just reduce power into the
transmission lines?

Solder a three watt 50 ohm non-inductive resistor directly into a PL-259 and there you are. Use a double-female barrel adaptor as a gender changer when needed. That will stand five watts momentarily, or better yet, get an SWR analyzer such as the MFJ units. They are much handier than an SWR bridge anyway. I wouldn't be without one.

It's good the robbers didn't go in and ask for technical assistance, they would have come out empty handed.

Removed all the crossposting, since only retards crosspost.

I am a slow code extra, and proud of it. However, if every ham that passed the tests 40-50 years ago was retested now, how many would still pass? I know one local ham that has been active since the 1950's and still is an advanced, he can repair or build all his own gear, but still isn't able to pass the extra exam. Put a current extra exam in front of most extras, I

don't think they would pass. I would be in favor of periodic retesting, just
like driver license vision testing, every 10-20 years you have to repass the
level of test for the license you currently hold.

And I am not afraid to use my real name and callsign or to build my own
equipment since that is what this group is really about inspite of the
misguided attempts of trolls to disrupt it.
thanks, John.

Hello all
I am looking for a schematic on the above oscilloscope. The thing blows the
fuse at switch on. Any advice would also be appreciated. I know there are
many of these old units out there
Thanks in advance
Joe

Andy writes:

A recent thread from a ham with a hearing disability who was looking for a way to make CW easier to copy caused me to think about something I had seen that might help. I will try to describe it...

The audio output was applied to an amplifier that had an artificial "threshold", like putting diodes in SERIES with the input so that no signal would reach the amplifier until the total level was high enough to break down the diodes .... only the threshold was more precise and not "soft"............. easy to do with op amps.....

The audio was adjusted to the point where NO signal would not produce and output and YES signal would simply amplify and cause an output...

..... much like adjusting a relay to click in at a given threshold....

Note that this does NOT increase the SNR because that has to be measure with a signal, and when the signal is present the noise is riding on top of it......

However it would produce more "abrupt" contrast between YES signal and NO signal..... much like the FM quieting phenomena that one of the posters in CW Remodulator referred to.......

   It might improve the ability to copy for someone with a
hearing disability..

   I haven't tried it, but I can't see why it wouldn't help.

If a reader has built it up, or something similar, I would
appreciate hearing about it..... or possibly where the
original article describing it appeared.... I'm sure it was
either the ARRL handbook or an old issues of QST....

    Just wanted to throw this in the mix. Good luck.

             Andy   W4OAH

Andy writes:

A FINE idea. And if the Extra needs to go to the restroom for some reason, the no-code should accompany him with a roll of tissue and assist in His endeavors.......

It's innovative ideas like yours that bring inspiration and, dare I say it, PRIDE to those who have joined the ranks of Amateur Radio. And I am shocked, I tell you, shocked, at the attempts of our members to discredit what is obviously a very inventive personality.....

There's no doubt in my mind that you could be another "Larry the Cable Guy" if you set your mind to it.   The world has far too many Einsteins and not nearly enough Howard Deans, and you might have a ready made niche.....

No one here thinks more highly of you than I ,

Andy

++++++++++++
I think a review of Slow Code's many posts on this and related issues
make it self evident.

where the eveidence you passed one

indeed based on the standard reasoning of the PrOcders one must
conclude that you are the result of a code waiver or some other form
of cheating

Over 30 years ago I designed and built something similar to what you're describing. I ran the CW signal through a sharp audio filter, detected it with a diode, and used that to key an audio oscillator (rather than amplifying the original signal as you describe). It was interesting, but worked only for a rock-solid signal which was simple to copy anyway. It didn't take much QRN or QRM to cut holes in the output signal which made copy impossible.

The brain is an amazing signal processing mechanism. It's really hard to beat. If I had a hearing disability, I'd look into various amplifying and frequency shaping devices and perhaps some types of audio signal processing. But in my opinion it's best to send more-or-less the original signal to the brain and let it do what it's good at. If that's not feasible, then use a digital mode that's specifically designed for easy detection with electronic circuits and let them do all the work.

Hi Roy,

So much depends on the nature of the hearing problem. I have a lot of holes in my hearing, as well as a different tone of tinnitus in both ears. It took me over 6 months/3 hours per day to learn CW to 5 wpm. And it still had to be crystal clear signal.

I learned a lot of things during this time. The main thing is that my brain gives equal weight to all sounds, whether the CW I am trying to copy, or whatever happens to be around it. Turns out that the same is true for multiple people speaking, or one person speaking with an air conditioner on in the room. This is probably related to the length of time that I have been hard of hearing (started at 7 with a bad case of the mumps, then the tinnitus started at 18)

Yup, I'm a big fan of PSK31.

I like it, but there's only one problem.  No-codes don't use toilet paper.

Somebody is going to have to Elmer them on how to wipe a butt and since
it's your idea....

If you're really a code tested Extra, why do you want to dumb down ham
radio? You should help me push for better radio exams by supporting an
increase in speed of the code requirement. If we can get rid of the
no-codes and nickle hams, test everyone up to 13 and 20wpm, no one will

```
have to sit on the floor at club meetings anymore.

I don't want to dumb down amateur radio, but you very much want to. You see, amateur radio is supposed to be about advancement of the art, and preparing and maintaining a civilian population with contemporary communications skills Mandating a mode that has fallen completely out of military and commercial use as obsolete is contrary to the concept of advancement of the art. It is as if blood letting was a required course for a medical degree.

Code is fine for those who like that mode. I use it at least once a month. However, it is no longer the mode that is best in weak signal conditions, or that uses the narrowest band width for effective communication. PSK31 runs circles around code. And guess what....many of the most fervent code guys I know cheat and use computers to print the received code on a screen, and a keyboard to allow the computer to generate their sending.

An amateur extra exam these days covers information a lot more current than that on the exam just a few decades ago. Perhaps instead of harping on code as some indicator of intelligence, you should direct your efforts to having all hams retested on license renewal, to make sure they continue to be current with the state of the art in amateur radio.   Or do you believe that de Forest era vacuum tubes are more relevant to amateur radio in the 21st century than integrated circuits?

I finally dug out the article. I haven't a clue to its worth, but I don't recall that sort of scenario coming up in other places (while the one about good filtering and using a detected voltage to key an audio oscillator came up a number of times), which may mean nobody found it useful, or nobody else could be bothered replicating the circuitry. What you want to do is check a few issues later, to see if there were any letters related to it in the "Comments" section.

It's interesting that the November 1971 issue of Ham Radio had an article entitled "Weak Signal Reception in CW Receivers", which used nothing cutting edge but was a summation of various things one could do to improve reception.

Go back a few years, and you'd see an article or two about "under the noise" CW reception, which of course amounted to PLLs driving some indicator, but at the time were pretty out of the ordinary since IC phase locked loops hadn't arrived.

I suspect to evaluate this, one really needs to dig through the magazines and look at all the schemes. Ham Radio seemed to have a fair number in the first decade or so. Something about that article you reference reminds me of something in an article about a Hallicrafter's diversity receiver, I forget the issue but it likely was in one of the annual October (or was it November?) receiver issues. About '74 or '75, someone named Hilbert had some scheme that involved active audio filters, but there was more to it than I can think of at the moment. (I seem to recall there was some "stereo" effect, in that different signals were fed to each ear, which in itself may be worth pursuing. Use one of those schemes with the detectors to key the audio oscillator, but also include some of the signal from the receiver output, so you get the noise and the actual signal in it.) Wait, I think it must have been "Hildreth", who also wrote this article you reference. In which case, you can look up what he did later; did he see some fault in this system, or did he just realize it was easier to implement something at audio?

Someone mentioned in this thread something that hinted at Coherent CW, which sync'd up the time and frequency at both ends to allow for good filters and fairly deep in the noise CW reception. If you know when and where to look, then it's easier to gather whether there's a signal there or not.

By looking at the various schemes people have come up with, one can get a better idea of each one's worth better than looking at each one by itself.

Some of the schemes likely panned out to be duds. Others required too much circuitry, at least at the time of the articles, so nobody wanted to replicate them. And then likely they've been forgotten, because otherwise more recent technology advances make the past easier (look at how phasing SSB returned to some level of popularity when ICs and digital audio came along). Others, like Coherent CW had the disadvantage that they were a whole system, rather than a processor, so you needed matching stations at both ends in order for it all to work.

You can at least look over the cumulative index of Ham Radio magazine, since someone has put it (or at least some version of it) online at http://webhome.idirect.com/~griffith/hrindex.htm

Ham Radio seemed to be the place to look for that sort of out of the ordinary schemes.

> The idea is to sample the last IF of a receiver after as much IF filtering as you can muster, and then using this as the RF input to a FM modulator. The RF/IF is modulated at the audio frequency you like to hear while copying CW. The next step is to frequency multiply the FM modulated signal to increase the bandwidth and up the modulation index. The following step is to treat it like any normal FM receiver IF and run it through a limiter stripping off any amplitude information. The last step is to put the signal into a normal FM discriminator to recover the modulating tone you used.
>
> What this is supposed to do is reduce or eliminate QRN (not QRM) from the CW signal making a "quiet" background to copy the CW.
>

It gets the on/off of the keying, but yes it limits the signals. So widely varying signals will be at about the same level (though that may not always be a feature), and any QRN will be limited too.

In thinking about it, I'm not so sure it's all that distant from the schemes that detect the CW and use that to key an audio oscillator. The bulk of the circuitry is not there to improve the CW reception, but to get that needed FM signal, with the incoming CW signal as the "carrier".

Again, the more I think about it the more I think his later audio based schemes may implement a similar concept.

Leif Asbrink, SM5BSZ, has some remarkable plots of moonbounce using
25W emitted from single 10 element yagi:

http://www.nitehawk.com/sm5bsz/kk7ka/kk7ka.htm

He gives his personal experience listening to weak Morse code here:

http://www.nitehawk.com/sm5bsz/weakcom.htm

His entire site is packed with very useful information on receiving
weak signals, including his Linrad setup:

http://www.nitehawk.com/sm5bsz/weakcom.htm

Well worth exploring if you haven't had the chance.

Regards,

Mike Monett

About tone detection in noise with biaural hearing:
In an ancient magazine article (If I recall correctly it was "dubus") there was a scientific reference mentioned. The signal must be delayed AND a difference in power level feeding it to the ears. They mentioned it is possible to get 3dB improvement with this methode.

Of course, detecting "submarine" is a good search for Google I think. They do worn stereo head phones.

Signal detection in general is how the processing is done:
- online or offline. Offline gives the added benefit of knowing all the signal in advance.
- bit-speed needed (Here the brain is bounded to limits)
- power level achievable (over background)

You can't beat the modern detection systems doing DSP algorithms.

- Henry

this is one TEK product which deserves the "heave - ho" (well, there are others like the audio sweep generator which they had outsourced) -- the CRT mesh is flimsy and deforms easily -- and the only correction is a new CRT.

I have a 2235A that I bought new in 1991 that is quite good. No problems.
Dual beam, analog, 100 MHz.

My shop scope is a Tek 2236, and I have the service manual for it that I
could scan portions of if helpful. I suspect there are close similarities.
However, for a few bucks, you can obtain the exact manual on a CD at:

http://www.pdf-manuals.com/

Keywords: EPP, parallel ports
X-Newsreader: NN version 6.5.0 #2 (NOV)
Xref: g2news2.google.com rec.radio.amateur.homebrew:7739

Hope this isn't too far off-topic, but maybe somebody who has actually
done something homebrew like this can give me some pointers.

I'd like to connect two PC's with EPP ports so they could "talk" to each
other (mono-directional at any instant but reversible -- probably by
passing a "token" back and forth -- and preferably NOT using interrupts
because I'll be doing most of the programming in a high-level language).

This is a one-off job and I'm not looking for elegance or portability;
I just want something to work reliably.

Maximum cable length will be be less than 10 meters, so propagation
time should be minimal.

The programming, itself, doesn't bother me, but it's how to CONNECT
the two parallel ports and how to implement half of the handshake.

Each port has the following pins/functions available:

```
DIRECTION:  DESCRIPTION(#)
      Out:  Write
    InOut:  Data (8)
       In:  Interrupt
       In:  Wait
      Out:  DataStrobe
      Out:  Reset
      Out:  AdrsStrobe
       In:  Spare (3)
   Ground:  (8)
```

Some connections are fairly obvious:
 * 8 data lines to corresponding 8 data lines
 * 1 (or a few) ground line(s) to ground line(s)
 * DataStrobe outputs to the other's Interrupt inputs
      (but I'll DISable the Interrupts).

Possible algorithm:
Assume one PC is started as SeNDeR and the other as ReCeiVeR:
Not sure how RCVR lets SNDR know it is ready to receive,
    but RCVR furiously polls the Interrupt input.
SNDR writes the data to its port.
  which causes Write to go low
  which causes data to be dumped on the output data lines
  Not sure what signal from RCVR should be the SNDR's Wait signal.
  but when SNDR's Wait is low SNDR's DataStrobe is set high

Something tells me this just isn't going to work!

HELP! Please!

Has anybody noticed that Super Glue (cyanoacrylate clear liquid glue) just doesn't seem to work any more? I remember when it first came out that it used to bond anything and everything. Lately, seems that I can't even fix my son's toys with it any more.

Latest failure: Just tried to glue a small 12V DC fan for a PA with it and the bond came apart the next day pretty much by itself.

Code is just one part of it. Here's my four step plan that will keep ham radio from becoming like CB:

Step 1: No more automatic renewals. Individuals must retest and
pass all elements required for their license class.

Step 2: The passing score for written exams needs to be raised to 85%.

Step 3: Code elements should be 13 wpm for General, and 20 wpm for Extra.

Step 4: Make the no-code license one year non-renewable.

Switch to two-part epoxy. You will, however, have to wait for it to set.

Actually what the FCC did was to take the 11 meter band and create the
General Radio Service Class C and Class D.
Class C was limited to only a few channels (6) limited to control and
paging. Class D was farmed out as 23 channels with only AM modulation
and a max. of 5 watts power input to the finals. This was later
modified to 40 channels and 4 watts input.
The classic CB'er came just prior to the increase to 40 channels.

Just out of curiosity, is there any reason you can't either buy what you're
asking for off-the-shelf in the form of, e.g., LapLink or else use an
interface that's better suited to the problem to begin with (such as Ethernet
or even those USB "networking" cables)?

The last time I did what you're after here was in the late '80s!

There are certain specific plastics (polyethylene, polypropylene, and Teflon) which most cyanoacrylates will not bond to properly (either at all, or without some specialized surface preparation). I believe that these plastics are characterized by low surface energy.

If what I read in some of the trade journals is any indication, manufacturers have been selecting newer and more specialized blends of thermoplastics and thermoset plastics over the past few years, in order to optimize the cost, strength, impact resistance, etc. of their products. It would not surprise me if you're more likely now, than a few years ago, to run into plastic-resin blends which cyanoacrylates have difficulty "getting a grip on".

A web page at Saf-t-lok indicates that "Surface ionization pretreatment is necessary to affect best results with instant bonders on non-polar plastic surfaces such as polyethylene or polypropylene. SAF-T-LOK� Surface Conditioner does the job."

Cyanoacrylates also vary significantly in their "grabbing" aggressiveness, viscosity, gap-filling strength, and their tendency to bloom (emit the classic eye-searing white fumes which then "frost" the surface around the application point). My impression is that the newer non-blooming formulations may not grab as aggressively, or hold as strongly as the classic variety. None of them seem to be

particularly good in gap-filling strength, unless you add an
additional particulate filler (baking soda is sometime suggested).

Abrading the surface with fine-grit sandpaper, and then degreasing
with isopropyl alcohol, can improve the grip significantly.

------------ REPLY FOLLOWS ------------

FWIW: Super glue should only be used for temporary fixes. Even though
it may be strong enough when first applied, it gets brittle after
about a year and loses much of its strength.

Bill, W6WRT

A continuous wave or continuous waveform (CW) is an electromagnetic
wave of constant amplitude and frequency; and in mathematical analysis,
of infinite duration. Continuous wave is also the name given to an
early method of radio transmission, in which a carrier wave is switched
on and off. Information is carried in the rhythm and spacing with which
the signal is sent. CW is thus is a form of on-off keying (OOK). In
radio transmission, CW waves are also known as "undamped waves", to
distinguish this method from damped wave transmission
 is endangered in the first place?

Hi
I'm looking for Direct reading SWR meter (schematics, pcb, solution,
ideas - anything)

Help please
MAc

PS - got QST 97/2

Country seems to be doing fine, Western might be sparse on the ground
but that's the nature of that beast.

Um, not quite:-) The very presence of the CW signal conveys SOME
information (e.q. the fact that something is out there generating it:-)

It's the turning on and off of the wave that conveys most of the USEFUL
information:-) Which makes CW communication a DIGITAL mode, by the way.

Harry

Many modern plastics are not effectively glued with plain old super glue (Well, for me modern is anything newer than Bakelite). There are some CA glues that include special activators to help stick to these plastics but they aren't magic bullets, they turn a failed joint into a marginal joint.

If you can rough up the surfaces involved (using more area than just the broken joint) and use a glue that will give a good fillet around the joint, that'll help. There are thick super glues and epoxies that help there.

It's very odd that a fan blade would have broken off all by itself. Usually indicates some sort of mechanical interference (guard loose, maybe bearings so worn that it's rubbing against something else.)

Tim.

FWIW, I've found a product called "Plas-T-Pair" to work in a lot of cases where "super glue" won't. Also, I've been using LocTite 444 "Tak Pak" alpha cyanoacrylate for other things, as it seems to work better than the thin mass-marketed superglues. LocTite 712 accelerator makes it set up quickly. In addition, any joint with stress (esp. tension) on it I'll augment with reinforcement of some sort. Lots of things work: embed a little scrap of cloth in the joint, drill mating holes and put in a peg made from wood dowel stock, or threaded rod (a cut-off machine screw, for example), or roughed-up steel wire, or even copper wire. Even wrapping sewing thread (or small steel wire) around the joint (if the geometry lets that work, so the thread crosses the joint multiple times) works wonders. Apply the idea of reinforcement creatively and you'll pretty much always get a much stronger repair. Even embedding chopped-up fiberglass in the glue will help. Hint: superglue alone is probably going to be fine in compression, so long as it's not subject to shock or excessive mositure, but in tension, it can benefit a lot from some help, especially if it adds reinforcement where the glue joint to the original pieces becomes shear instead of simple tension--i.e., adding pegs in holes.

>From your post, I'm not sure just what part of the fan you were gluing.
 If it was a broken blade, I'd expect to need to be very careful with the repair because there's a lot of stress on the blade when the fan is running, and adding mass will imbalance the blade if you're not

careful.

Cheers,
Tom

Crimping might be appropriate for a large volume of coax connectors.
However for a limited number of connectors as applicable to domestic
amateur radio a gland type of cable entry seems more to the point.
BNC- , PL259- and N-connectors are all available with braid sleeve
inserts which highly likely give a better (long term) braid/connector
connection than a crimped arrangement at least for RF ,especially when
used in an outdoor environment.
I do have a short lead with 2 PL259 connectors with both centre pin
and body crimped to RG58 coax which probably originates from the 'CB
trade' .The braid crimp is not a hexagon but cylindrical with side
ridges, like -O- . I would never want to make up leads this way myself.

It is hard to go wrong with any Yaesu or Icom radio.  If you find you
prefer something else, there will be no problem trading or selling it,
assuming you will lose a bit of money after it has been used.  Chances are
very good you will not want to part with it...I wish I still had my first
radio...

If Slow Code left, I would miss him.

I do not agree with him most of the time. As a matter of fact, he is dead wrong a lot of the time.

At least he stands up for what he believes in.

I myself, do not think that every ham should have to be able to send/copy code at 20wpm no more that I think they should be tested on psk,rtty, slow scan tv. etc.

Some people have a passion for code and some have a passion for other modes. I use them all from time to time, and to be honest, after I move next year, I am going to work on my code a bit more when I have the time to do so.

However, I will still give him a hard time about his ranting. After all I have not heard anyone tell him that he is not a real ham because he does not have psk nailed down..HI HI
Joe

Markie you blithering idiot. You're against being a knowledgable ham so
bad you have no clue what I was even talking about.

I was part of the big RRAP CW and anti-ARRL fights of the late 90's up until restructuring went into effect, then my posting tapered off. I'll disappear again once the FCC totally kills off ham radio by eliminating the code requirement. When that happens, I'll wear a strip of black electricians tape around my arm in memorial and observe twenty-four hours of radio silence in memory of a once proud service.

Rest in Peace, Ham Radio. You were a good and faithful friend.

SC

> used in an outdoor environment.

I would be prepared to debate this. A properly-done crimp connection, made with high-quality connectors (I'm talking Amphenol RF or King) and done with a high-grade crimper will be gas-tight. If you enclose the whole thing in the sealant-lined heat-shrink tubing after you've made up and tested the cable, there's no reason it won't do just as well as a gland type.

And, with crimping, you stand a much lower chance of heat damage to the insulation. ;-)

I absolutely agree. That's why I suggested the Daniels crimper. Its dies are all hexagon style, per mil specs.

Keep the peace(es).

I am looking to hire someone for a few hours to give me advice on a
design for VHF ASK radio transmitter and receiver that I have designed.

The design is running but I need to improve sensitivity a bit and TX output power.

If you are interested please contact me by email.

Regards

David

```

Friend,

I'm always looking for good and intelligent individuals like you to visit my website, www.ChezBrandon.com , and it has pictures of beautiful women, information about aged clones, and a link to Ultimate Fighting Championship, a very good show.

My name is Brandon, and I'm in my 20s, am a college student, and as lie detectors, both conventional and unconventional would show, I've never been sexually penetrated. Moreover, I could be shown pictures of X, Y, and Z, and it would show that I'm only sexually attracted to women.

The Murders of Our Leaders in Government were Stopped.

I, Brandon, can take lie detector and psychological tests, and I can go before a panel of truth detecting experts. I tell the truth. A mini-psychological test: 8 times 2 = 16, the world is round, not flat, and the year is 2006. Feel free to call me, my cellphone number is 503.740.0272 (United States based) and feel free to utilize a GK-1 voice truth detecting device too:

>From Congressmen Bill Frist to John Kerry to Dennis Hastert to Hillary Clinton to John Warner to Ron Wyden to Gordon Smith to John McCain to Joseph Lieberman to Nancy Pelosi to Diane Feinstein to Ted Kennedy to anyone else who happened to be in the Congressional chambers during either a joint session of Congress or a State of the Union address from Masons to Skull and Bones members to Secret Service agents to pages to visitors to other good individuals, they all would have been murdered, all of their accomplishments stripped away, their earned wealth stripped away, their homes stripped away, their family and friends stripped away. Moreover, someone else would have been sleeping with their spouses.

Elements of the Mossad, who wanted to bathe in the blood of our Congressmen as well as bathe in the blood of leaders around the world, and when they seized power they would, as confirmed by psychic vision and confirmed auditorially, "he's right; he's psychic," would outlaw most if not all organizations, including the Masons, and these elements as Victor Ostrovsky writes about in his #1 New York Times bestseller By Way of Deception are out of control, notoriously lie, and have a disregard for life -- I was able, thank God, to thwart the conquest of the USA and the world, and was able to thwart the murder of United States and world leaders, via a psychic vision of Senator John Warner and other Congressmen being choked to death by gas, which was confirmed auditorially from both ears, such as "He saved Congress," who they were going to kill "all of them,""how did he know that?" and "he's psychic" -- murdered my biological Aunt Gloria Atkinson, whom I loved very much, as she did of me, and there is a tribute to her on my website. Please, friend, be sure to barricade your bedroom door at night. I'm not afraid of aged clones or the attempted chopping off of my appendages (elements of the Mossad talked about chopping off my right middle finger and right ear, and 10 out of 10 of my toes, like my right middle finger have unique steeple designs).

I'm not afraid of anything. I'll defend myself to the best of my ability, and I commit my life to saving the lives of men, women, and children and strengthening good organizations. I will always remember my biological Aunt Gloria Atkinson. Sincerely, Brandon

If you enclose the whole thing in the sealant-lined heat-shrink tubing after you've made up and tested the cable, there's no reason it won't do just as well as a gland type.

I keep reading that crimp connections are more reliable than clamp type, but my experience sure runs contrary to that conclusion. I have a sizable quantity of patch and longer RG-58 cables with crimped BNC connectors. Most are from the Tektronix surplus outlet, but some from other industrial sources. All were presumably made by skilled people with the proper equipment, and they were manufactured over a long period of time. Yet on many cables, the outer insulation has pulled out from under the crimp, leaving bare shield. Besides an obvious entry point for water if used outside, the shield wires begin breaking from flexing against the hard crimp connector end. In contrast, I've never had a failure of cables I've made myself with crimp type connectors, although some have gotten very severe and prolonged use.

I imagine that adding sealant-type heat shrink tubing would delay the onset of the insulation migration problem and reduce shield breakage after it occurs. But that's an extra step not required for clamp-type connectors.

In addition, some "precision" cables made with double-shielded cable were very RF-leaky at the connectors, a problem I solved by replacing the crimp connectors with clamp type.

So I have what I've read on the one hand, and what I've experienced on the other. The only conclusion I can reach is that it must be a lot more difficult to "properly" assemble a crimp connector than most people realize. I figure that if the pros have so much trouble doing it right, I don't have a chance. I'll stick with clamp type. My feeling is that the reason that crimp connectors have become so popular doesn't have anything to do with reliability but simply that they're faster to assemble and therefore cheaper.

> And, with crimping, you stand a much lower chance of heat damage to
> the insulation. ;-)

The only heat involved with clamp type connectors is in soldering the center pin. Hopefully most people can manage that -- I've never had a problem, anyway.

That last sentence should read ". . .with *clamp* type connectors. . ."
I've never made a crimp type myself.

Hi;

I need a schematic of a 50W or less 144MHz PA, with about 5W input......

The PA isn't big problem I'm worried, but real problem is switching RX/TX.....

Thanks for the help, Andy... I muddled through it (it's a little odd the first time you've normalized your Smith chart to 1800 ohms and the termination is 50 ohms!) and the filters do work as their data sheets say.

I did find that xtal filters can easily drive a network analyzer nuts... even for looking at a single frequency, I had to significantly increase the sampling time well above the default to get a stable display. I'm thinking this is due to the absurdly high Q of the crystals causing a very long transient response, thereby necessitating a long sampling time to finally measure the steady state response.

---Joel

I have a friend that just bought a used Ten Tec Scout, it came with a 40m and a 80m band module. He is looking for 30m and maybe 15/17m as well.

If you have any of these you'd like to sell, please send me an email.

How are you going to save a life with CW? If someone is having a heart attack he's not going to be steady enough to type out an SOS to you.

No planes use morse code. No ships do either. Just who do you think is going to send you an SOS?

I just purchased a crimp tool and dies for RG8/213 from Davis RF... It was eighty some dollars for the tool, two sets of dies, and a carry case.. I have a bunch of cabling to make for the station revisions in progress... This was a whim decision and I will post my thoughts after I use it a bit...

  Many years ago in the TV bussiness we would use a alliance tenna
rotor 4 - wire on a 3 - wire
channel master control box.  Now i have the same combination i need to
install on my 6 meter beam
however i fot got the wiring setup?
 Does any remember the proper wiring, i think it was combine 1&2 or 3&4
but i cant remember the
setup.

Andy writes:

Joel, one more thing comes to mind.

I like to match impedances using a "double Smith chart". On this
chart,
a normal smith chart is in one color while the mirror image is in
another
color.....
It is called an "impedance-admittance" chart.

One can follow the series reactances along one color, and then
the parallel reactances along the other, to get from the starting
point to the ending part....

Once a person is comfortable using this method, it gives a LOT
of gut feel insight to the various combinations of matching networks
you can use.....

I had to design an automated antenna tuner for Texas Instruments
once, for the HF SSB marine system, and I used the double Smith

Chart to figure out what the combinations needed to be, and then wrote a computer program that would step reactive elements in series or parallel . The automated system therefore just stepped along the curves exactly as I had done by hand..... That was about 30 years ago.

Anyway, the Smith Chart, and various derivative versions, is great because you can see a much larger 'big picture" rather than just discrete values at discrete frequencies...... It's a good and very useful skill to have... among others..

Hi,
I would like to tell you about my new site for DIY transmitter for 3 meters. There is a lot of transmitters, amplifiers, antennas. The site is in german language, but pictures are international.. :)

Visit it one time
www.senderbau.egyptportal.ch

best regards

Yep, that will always work. If you aren't tied to the AD9954, I would suggest the AD9959 or AD9958. You get 4 or 2 channels in one chip with lots of control. Cost more, but pretty nice part.

Steve.

I have been looking into gizmos that improve CW copy. Most are audio tone detectors that ignore short impulse noise bursts and then regenerate the CW with a keyed tone oscillator. There are several of these designs around and they are all well and good, but I stumbled across something different and was wondering if any of you have had personal experience with it?

An October 1971 article in Ham Radio magazine (pg 17) titled "high-performance CW processor for communications receivers", "Frequency modulating the telegraphy signals in your receiver provides an interesting and profitable addition to conventional receiver design".

The idea is to sample the last IF of a receiver after as much IF filtering as you can muster, and then using this as the RF input to a FM modulator. The RF/IF is modulated at the audio frequency you like to hear while copying CW. The next step is to frequency multiply the FM modulated signal to increase the bandwidth and up the modulation index. The following step is to treat it like any normal FM receiver IF and run it through a limiter stripping off any amplitude information. The last step is to put the signal into a normal FM discriminator to recover the modulating tone you used.

What this is supposed to do is reduce or eliminate QRN (not QRM) from the CW signal making a "quiet" background to copy the CW.

Have any of you ever done this and how did it work out for you?

- Jeff

Perhaps I'm spoiled by having access to VNAs and spectrum analyzers with tracking generators. :-)

It's sad that *good* spectrum analyzers are still quite spendy, even on the used market. There are several "homebew" spec. ans. out there that are quite impressive, but none that come close to even something like a 15 year old HP 8594.

Andy,

Thanks for your response. I guess I'm looking for a magic pill (though I know better). I agree that the human brain/ear combination is unsurpassed in digging out the really weak ones or the weak signal our of the pile up. My unfortunate situation is my degenerating hearing. I now wear hearing aids in both ears and have difficulty understanding spoken conversation no matter what the volume level. I have always been a CW only operator so the loss of SSB use doesn't seem so bad. I can copy CW much better than listen to voices, but I can never be sure that I can still dig the weak signals out of the mud and I'm pretty sure I have lost some ability to deal with pile-up QRM. So I'm grabbing at straws for gizmos to help me out as my hearing digresses.

They're doing amazing things with PCs and soundcards, doing waterfall plots to pick out weak signals. Perhaps this would work for CW as well -- and if it does you can take a break from the hearing aids entirely, and just do it all visually.

Alas, I don't know what the right software to use would be.

Interesting. I recall reading (in QST, no less) of PSK QSO's where the human ear could NOT even tell a signal was being received, yet the screen copy was "5x9" (if such a phrase even has meaning in this context!-)

Sorry to hear about your hearing problem, apparently you have problems of hearing some specific frequencies.

I don't know if this might help you, but one interesting observation about a A1A beacon and FM receivers may be of interest.

We have a nearby microwave beacon sending out call sign and locator using ordinary on-off keying. When receiving the signal on an FM receiver with the squelch fully open, full quieting is achieved when the carrier is on, but strong "FM-hiss" is audible, when there is no signal.

After a while, it was not too hard to copy the beacon message in this "negative-CW" format.

Since the FM-noise contains white noise, it should be detectable even if some spot frequencies are undetectable due to selective hearing loss.

One approach would be to run the CW signal through some kind of FM receive, limiting the carrier, but producing white noise when no signal is available (and you would have to learn to copy negative-CW) or alternatively use some amplitude detector to control a noise gate, i.e. when there is a carrier present, the white noise would get through, with no signal, the headphones would be silent.

Just an idea.

Andy writes:

A hard limiter decreases the signal to noise by about 5.6 db, and that's a mathematical fact...

If we know the characteristics of the noise, and the characteristics of when it occurs and the distribution of the energy, then we have "a priori" experience , and it really isn't "noise" anymore, and it can be dealt with --- in some cases rejected - and it's effects on the intelligibiliy of a desired signal made less...

There are two characteristics familiar to a radar engineer, which deals with detection of a signal in the presence of noise::

Probability of detection -- Which is the probablility that a signal will be detected in the presence of noise without an error.

Probability of false alarm -- This is the probability that detection of a vailid signal will occur when there is, in fact, no signal present.

Entire volumes have been written on Pd versus Pfa, since this means life or death to an aircraft (for instance) when a missle lock may happen.....

If the other guy detects you and sends his missle before you do, you will probly be dead.
If you fire your missles off at a ghost and have none left, you will

probly be dead..

In the final analysis, CW is just On-Off signals, much like pulses.

The bottom line in all this is that if you KNOW what the signal is going to do you can increase the chances of detecting it properly.

For instance, if the signal is repetitive, it can be stored, integrated, differentiated, or accumulated with weighing functions to recover the intelligence ---- "a priori" knowledge is necessary..

If you know what the noise is going to do -- impulse, popcorn, static, broadband, random, etc --- you can use techniques to reduce it hopefully without reducing the signal..

So fancy noise limiters, signal enhancers, and innovative detectors will work on some types of interference, and not on others. To be a universal S/N improvement, it has to work on "unknown" interference...

That's what the ham bands are like. It could be AM splatter, white noise, a welder machine, the "woodpecker", car ignition..... whatever....

That's what restricting the bandpass does, usually. Sometimes it makes the S/N worse, but only with "special" types of interference.

There ain't no "magic bullet".....

The subject is a LOT more complicated than just any single simple technique for recovering a signal...

However ,our ear/brain, with PRACTICE is an adaptive filter. It's amazing how well it works, after someone has been copying CW for a while. Perhaps a microprocessor controlled adaptive filter can be made to approach it, but ADAPTIVE filtering is the only hope that I can see, given the different types of QRM and QRN that I have encountered. My best bet is that someday an adaptive CW filter would be to do as good as my own ear could do today.....

It's like looking at a noisy signal on a scope. Someone with a lot of practice can see a valid signal several db lower in S/N than a novice can do.... Sonar operators can do the same.....

"Waterfall" displays simply integrate the signal and noise over time, which is similar mathematically to restricting the bandwidth as far as the S/N "enhancement" properties.... The characteristics of the signal

and the characteristics of the noise are known beforehand, and
that is used, via the display, to increase the Pd and decrease the
Pfa....

End of rant..... I need a beer.

Andy W4OAH

Nah, all HF bands are for sale. Lord help the rest of the world after the
FCC finishes their work. People like SC are the reason for this.

Hi,

I need some toroidal cores(powdered iron or ferrite) for general HF
use. So i guess i will be looking for cores in 3-30~ MHz range. I have
access to Philips toroidal cores in where i live and i need your advice
to find the suitable one. Waiting for your answers...

Thanks...

Back in July I wrote:

I'm reading David Rutledge's excellent "The Electronics of Radio."
In Chapter 10 -- Power Amplifiers, he discusses Class C amps and says,
"In addition, if we drive the transistor clear to saturation, using the

transistor as a switch, the dissipated power can be greatly reduced,
because the saturation voltage is low. This is Class C
amplification..."
I'd always throught that in Class C, while you'd operate the device so
that it was cutoff during most of the cycle, but not saturated.
Is this just a different definition of Class C?
I checked back with SSDRA and EMRFD, and didn't see anything about
driving Class C amps into saturation?
What says the group?  Do we saturate in Class C or not?
-------------------------------------------------------
I've been thinking about this some more.  The 1980 ARRL handbook points
out that "Solid State power amplifiers should be operated just below
their saturation points for best efficiency and stability."  Also, the
formula that we use to determine load resistance (Rl=Vcc^2/2Po) implies
that we are looking for a combination of Vcc, Load resistance and power
out that will prevent saturation.
And wouldn't we end up with far lower harmonic content if we only clip
one side of the wave form (at cutoff) instead of both sides (cutoff and
saturation)?

I know there are more exotic modes beyond C, but for plain old ordinary
ham radio applications, don't we normally avoid saturation in Class C
amps?

Also, what about this business of having the efficiency improve through
saturation "because the saturation voltage is low"   Could that be
right?   If you put a voltage across a conductor and generate a large
current, you can't sit back and say "Great!  Power consumption across
the conductor is low because the voltage drop across it is now
minimal!"

I hope 11 meters opens up so you can get back on the band again and leave
the net for awhile.  You're a bad influence on Mark in the Dark.

AFIK a Preamp is used when referring to HF and VHF communciation
receivers. An RF Amp refers to the final stage of a transmitter and an
LNA is generally used when referring to Microwave or sattelite
receiver. I note that the preamp/frontend of the R2 is referred to as
an LNA.

A properly designed crowbar should be able to handle the current and
stored charge of the supply it's monitoring. If a crowbar fails short
in the process, it's still doing it's job, but that is unlikely to
happen if foldback limiting occurs.

OVP and current limiting are both possible using small-signal
techniques, but the OVP's latch may require an independant method of
crossing the isolation barrier for effect.

Actually, a Crowbar System ONLY needs to be able to blow the fuse,
or circuitbreaker that protects the LOAD from the overvoltage
condition that the Crowbar is monitoring. Protecting the supply
from overcurrent draw condition is the Foldback Current Limiter's
Job. Two completely different senerios.

Hello all -

I built a simple ferrite antenna communication system. Unfortunately it
won't work if I set the sender more distanced than about a meter. That is
even true with different transmitter configurations.

Here the details:
Transmitter:
ferrite antenna: diameter 8mm , 50mm long
frequency is 77.5KHz, digital modulation is AM 25%
bit-rate is 1 bit/sec (0 is 100ms carrier 25%, 1 is 200ms carrier 25%)

insulated copper wire coil 10 turns

The transmitter is self-constructed and delivers a very good signal.

Receiver:
same antenna copied, but a built-in resonating capacitor.
ready-to-use WWVB 77.5KHz receiver. Demodulated signal goes to scope.

The transmission works over about one meter without any shortage.

Now the problem is that I can change the transmitter parameters but I cannot reach a substancial greater distance. I changed:
- the coil wound times
- output current to the antenna (measured across a series resistor)
- added an antenna current sensor coil to sense the antenna current and to see if the ferrite antenna saturizes (NO! Very clean sinusoid)

Googling around to find theoretical aspects of ferrite antenne got no good results. I spent several hours and read all I can read.

Have someone suggestions to try or good links to read? Especially for:
- when a ferrite or iron powder rod/bar goes in saturation?
- optimal rod dimensions
- optimal coil design (I suggest single layer, resonating with good Q capacitor, about 3 to 10 turns)
- LNA design for such a low frequency?
- antenna field theory in near-field.

If you need further details please ask.

Thanks in advance.

Regards -
Henry

The propagation mode here is pure magnetic coupling, not a proper electromagnetic "radio" wave, because the antennas are so small compared to a wavelength. Dipole magnetic fields fall off with the cube of distance.

A lot more turns on the rods, and resonating with a cap, will help some. Longer rods would help some, too, but 1/d^3 is a cruel function.

How far do you need to go?

John

>> A properly designed crowbar should be able to handle the current and stored charge of the supply it's monitoring. If a crowbar fails short in the process, it's still doing it's job, but that is unlikely to happen if foldback limiting occurs.
>
>Actually, a Crowbar System ONLY needs to be able to blow the fuse, or circuitbreaker that protects the LOAD from the overvoltage condition that the Crowbar is monitoring. Protecting the supply from overcurrent draw condition is the Foldback Current Limiter's Job. Two completely different senerios.

The aim is to protect downstream components from overvoltage. Overvoltage is an indication of loss of control. To count on the presence of other limiting circuitry, completely independent of the voltage regulator, may be whistlng for it.

At one time, thyristors with large I^2t characteristics were marketed for crowbar applications. Nowadays, it might be more sensible to make use of a semiconductor circuit breaker, integrated into bus sequencing circuitry.

Hi!

I remember 1/d^4 for a full EM-field here.

The receiver is a WORKING time-code receiver. Working in distance at least 2000km from the time-code transmitter with an EIRP of 30KW. The time-code transmitter have of course a VERY BIG antenna (120m height).
So I'm a little confused of your capacitor idea. That is true?: The transmitter is NOT sending an electromagnetic wave but the same antenna system at the receiving end reads it as an full established EM field?

How far: Hm, several km's if possible. Maybe I should go higher in frequency?
What other small effective antennas work here?

I think the problem is not the minimum turns because I tested it with an original ferrite rod - the same as in the original time-code receiver. It have a lot of turns, probably 100 or more. The same behaviour with 100 turns AND with 10 turns. No difference!

What I understand of ferrrite antenna theory is:
That the coil is simply an impedance transformer and bandpass (with a parallel capacitor for narrow-band reception) to couple the preamplifier to the antenna system (= ferrite rod).

But I miss something. Maybe something with differences between transmitting and receiving with a ferrite antenna. The antenna is not pure reciprocal - because the ferrite (or iron powder) can be nonlinear!

Yes, a ferrite stick antenna works quite well for receivers, but not for transmitters. Try winding a few dozen turns around the whole room - i.e., up the wall, across the ceiling, down the other wall, across the floor, and so on. Or, you could wrap a piece of 50-conductor ribbon cable, and make loops by soldering the ends together offset by 1. ;-)

I don't know very much about antenna theory, but I know that the bigger the better. ;-)

Something's telling me that it's theoretically possible to transmit with a ferrite stick, but from the kind of power you'd have to run through it, it would probably blow up. =:-O

Good Luck!
Rich

1. Ferrite and powdered iron are entirely different materials, with different physical and magnetic characteristics. Powdered iron isn't a good choice for this application.
2. You're not likely to drive either one into a nonlinear region when they're in the form of a rod because of the large air gap in the magnetic path.

In addition to what others have said, the most field you can
generate with the ferrite rod antenna will occur when it is
almost reaching saturation, and that takes a lot of ampere
turns. You can deliver more ampere turns to the rod than

your transmitter output can deliver if you resonate the coil
with a capacitor. That way, you have the current bouncing
back and forth through the capacitor added to the current
from the amplifier. If the coil-capacitor Q is, say, 100,
there will be 100 times more current through the coil than
the transmitter is delivering. This will probably take a
coil with a considerable mass of copper in it.

With this approach, you might reach 10 meters.

So there is a resonant circuit at the transmitter and not just a coil?

With such low number of turns (and hence low inductance), the
capacitor would have to be huge to resonate it at 77.5 kHz. Where do
you get high Q capacitors with such capacitances ?

The resonant circuit impedance levels are quite low in this configuration (small L/large C), how do you effectively couple power from the transmitter to this low impedance level at the resonant circuit ?

The skin depth at this frequency is about 0.25 mm, so any wire thicker than 0.5 mm will not utilise the full copper wire, so some kind of Litz wire with separately insulated strands could be used to keep the coil resistance low.

The inductance of some ferrites varies if there is some DC field present. This inductance change could detune the resonant circuit and drop the radiated power. Are you sure that the transmitter coil is not carrying any DC components or some even harmonic distortion, which would cause an unbalanced magnetic field in the ferrite rod ?

>- LNA design for such a low frequency?

The band noise is the dominant (compared to "white" amplifier) noise when listening to the band with your transmitter switched off, the receiver noise performance should be adequate.

Paul OH3LWR

I can't really help you with ferrite antennas for transmitting, but can
tell you that if you google around for "lowfer" and the Longwave Club
of America http://www.lwca.org/ you will find a lot about antenna
designs that are suitable for this band. They will also might have
recommendations for frequencies of operation that are legal for
transmission in your home country (I don't even know what that is!)

LNA isn't really applicable here because there is so so so much man-made and natural noise in this band.

I'm a little surprised that your achieved range was so small from a
ferrite rod antenna, actually. Did you really tune both antennas, in
place and in circuit, for resonance? The resonance is so so super
narrow that strays between design and circuit make a big difference. I
mean, CRT screens with flybacks, and faulty flourescent lamp ballasts,
and incadescent dimmers radiate all sorts of crap around the LF
spectrum for blocks, and they aren't even trying to be intentional
transmitters! And don't get me started about induction heaters and
welding machines, those can be heard across several states!

Tim.

You made my day :)
BTW: Your idea with the ribbon cable gives you a very easy made
transformator if using clamping connectors. This works very good. I
practiced it 10 years ago.

I heart it several times that a ferrite stick antenna cannot work as a
useful transmitter antenna. But why?????

>
> I don't know very much about antenna theory, but I know that the bigger

Sure, for reasonable antennas. But if the antenna is very VERY big in
relation to wavelength it even cannot work! Read somewhere.

>
> Something's telling me that it's theoretically possible to transmit with

I found no saturation state but I have not enough power at the moment to
drive it very powerful. Something I try later ...

John, that is what I have seen! I resonated the antenna coil and driven it with it's resonance frequency. Seems that the achievable distance was a little more than the circuit without resonating capacitor.

You say, that driving the ferrite rod into saturation will force it to leave more power into air? Why?

> 1. Ferrite and powdered iron are entirely different materials, with different physical and magnetic characteristics. Powdered iron isn't a good choice for this application.

Powdered iron should work better because of the higher permeability even under heavy load in comparision to ferrite. I think so in theory - not tested.

> 2. You're not likely to drive either one into a nonlinear region when they're in the form of a rod because of the large air gap in the magnetic path.

Can you explain this more detailed Ron? What will happen with the air gap? The losses in the air gap radiates and that is the antenna function?

I tested it as resonating circuit using the original time-code receiver
antenna AND a second time without the capacitor.
Maybe I got a little more power in the air with the resonating circuit, but
it was not very distingiuable.

> With such low number of turns (and hence low inductance), the

I don't know the exact manufacturer of the time-code receiver ferrite
antenna but I comparable model reads:
L=900uH
bandwidth=700Hz
n=94
see original data
http://www.hkw-elektronik.de/pdfenglisch/AFET100-77,5-DE.pdf
It is not the same antenna but very similar.

The original foil-capacitor is 682 labeled. I don't measured it but I think
it should be 6800pF reading.

For my second experiment I used no capacitor and turns=10.

If I would find a PSPICE model for an ferrite antenna ...

>
> The resonant circuit impedance levels are quite low in this

Hm. I thought here: just trying different turns value to achieve this. The coil is the impedance transformer for the ferrite rod (=antenna). I'm wrong here?

The original coil is thinner than 0.3mm. If I compare it to my 0.3mm wire maybe it is 0.18mm. The second experiment with the 10 turns coil is 0.3mm enamelled copper wire.
I will give Litz wire a try if the system as such works...

Good question. I series blocked DC with a WIMA MKS4 1.0uF 100VDC high-quality capacitor. As measured the "big" capacitor is outside the bandwidth of the antenna.

I don't think there is any DC component left. And yes, there is no magnet on my desk laying around :-)
Is there any internal rectifiation phanomen in the ferrite possible?

>

How much band noise should I expect?

Efficient antennas at that frequency are effectively very long
bits of wire. The ferrite rod is small compared to the wavelength
and very inefficient at generating a far field.

This is the antenna of the DCF77 transmitter (same frequency):
http://de.wikipedia.org/wiki/Bild:Dcf77.jpg

Kind regards,

Iwo

You misunderstood what I said. It was, " the most field you can generate with the ferrite rod antenna will occur when it is almost reaching saturation,"

If you saturate the rod, the field you generate will have lotsof 3rd harmonic components in it, but little more of the fundamental. I was trying to emphasize that you will need as strong a magnitic field as possible aat the transmitting antenna, and just below saturation is that limit, when a ferrite core is involved.

If the rod has a large lenght to diameter ratio (say , above 10) then I think the uptimum coil arrangement on the rod also doffers considerably for the transmitting and receiving cases, since the receiving case does not deal with saturation.

In the receiving case, the end sections of the rod act as flux collectors, and only the middle thirs or so has almost all the collected flux passing through it, so this third is the optimum place for the coil. /in the transmitting case, the rod has a tendency to saturate at the center, first, with this arrangement, and you want essentially the whole rod to approach satuation at the same ampere turns. This will produce a field that acts as if it has been produced

by the full length of the rod. You can achieve something close ot this
by spreading the turns out, all over the rod, with an extra
concentration (a second or third layer layer, perhaps) at the ends.
Something like this (shown in cross section. View with fixed width
font i.e. Courier, so charcters are on grid pattern):

* = wire in cross section
# = rod

On a reciever, I'm using a MMIC LNA at VHF (2m), and while it's quite clear to me why I need to match at the amplifier's input -- to minimize VSWR and get as much of the signal from the antenna into the system -- it's not quite to clear to me just how important output matching is. The S22 parameters for this LNA are very close to an open circuit with a little capacitance -- I expect the output looks back into a drain or something else that's a reasonably decent current source at RF, and you see that shunted by parasitic capacitances.

So... how important is it that I bother to build a matching network at the output? (I'll be "outputting" to another ~50 ohm input.) It doesn't really seem that important, and building something like an L-match with de-Q-ing resistor drops the gain a couple dB anyway.

I know that for a transmitter output matching is important so that reflections from poor or non-existant terminations don't blow up the output amplifier, but for low-level signals as in a receiver it wouldn't seem to matter so much?

Thanks,
---Joel Kolstad

OK Iwo. But why a small receiving ferrite antenna works here? A non-saturated (=linear, and that means the superposition theorem works) antenna system is reciprocal as antenna theory predicts. So you should explain where the difference is!

> transmitters! And don't get me started about induction heaters and
> welding machines, those can be heard across several states!

Maybe the time-code receiving IC is a bad design. I don't know. It's operating current is 500uA only. That is very small. It can receive the time-code over 2000km with such an antenna with an transmitter EIRP of 30KW. The receiving antenna is 700Hz bandwidth. I don't think this is super narrow. Even if we look at the time-code receiver quartz filter with a bandwidth of about 10Hz I can met it with my stable wave generator. It is a PLL-design with a clock quartz. Should be typical 10ppm. I don't have a very good frequency meter to verify it.

In my second transmitter experiment I used a not-resonated driver design. So there are no problems with detuning the transmit antenna expected. It is just driven by the 77.5KHz power signal.

CRT screen is off if I experiment. Otherwise I seen a very big CRT signal at the receiver...

If the two ferrite rods will detune because of the close proximity I cannot control it. I don't think so.

If you can hear induction heaters or something this is surely with a very big antenna and a resonable good receiver design.

I understand that. I added a second coil on the ferrite rod to measure the
antenna current and set it just below the point where I saw harmonics (or
say non-sinusial) waveform on the scope.

That is a very interesting configuration. Never seen such a design. I read
about a old-fashion remote controller system having a ferrite antenna
transmitter. There someone wrote, the transmitter antenna was a mignon
battery-shaped ferrite rod. e.g. much shorter but wider than mine. So an
optimum ferrite transmitter antenna is maybe more like a fat battery shaped.

OK, since you called it an LNA, I assume you want to take advantage of the low noise. In that case, you do NOT necessarily want to match the input for low SWR. You want to match to the amplifier's input noise resistance: the equivalent input noise voltage divided by the equivalent input noise current. This in general is NOT the same as the input impedance. Adjust the input match for the lowest noise figure, not the lowest SWR, if it's low noise you want.

Output matching will transfer the greatest power to the load. Assuming S12 is very low, adjusting the output matching will not materially affect the input power, so maximizing the output power will maximize the gain. You may or may not have a need to do that. And you need to pay attention to amplifier stability: is it unconditionally stable, or must you keep the load within some bounds to keep it stable? Have a look for articles about "maximum available gain" and "maximum usable gain." For example, see http://www.microwaves101.com/encyclopedia/kfactor.cfm#mag.

Cheers,
Tom

The problem with loop antennas made of ribbon cable (or other
multiconductor cable connected this way) is the stray capacitance
between turns. The self resonance frequency (without external
capacitor) may be below the band of interest, so you can not resonate
such antenna with an external capacitor.

I found it very useful for design of hard-driven Power MOSFET driver transformator till 400KHz without problems.

Hi Tom,

Thanks for the information; someone else pointed me yesterday to the idea that you'd generally match the input for optimum noise performance rather than optimum power transfer. The data sheet claims that the optimum noise figure is 0.8dB, but the part itself is marketed as "typical 1.8dB NF" -- which they obtained from their own eval board that, as far as I can tell, was matched pretty close to optimum power transfer. In any case, at present mine is also matched at the input for optimum power transfer, and I'll measure its noise figure and see whether or not I'm around 1.8dB or better... if so I don't think I'm going to worry about it too much.

> Output matching will transfer the greatest power to the load.

Yeah, but it's not practical, is it? I'm looking back at (approximately) a current source, and my load is dictated as (approximately) 50 ohms, so the load itself is what's driving the power transferred, no?

> Assuming
> S12 is very low

It is, <0.01 everywhere.

> And you need to
> pay attention to amplifier stability: is it unconditionally stable, or
> must you keep the load within some bounds to keep it stable?

I haven't calculated its k factor; I'll do that soon -- thanks for the link.

---Joel

At LF, rarely is the problem "not enough amplitude of received signal", so past a certain point there isn't much need to make the receiver antenna more efficient. The problem is always "too much noise!". So antenna designs are usually built around nulling out local noise, and loop antennas will get rid of the mostly electric-field local noise. And they have some directionality (notably sharp nulls) which can help get rid of specific further-away noise.

Tim.

Well, no... Clearly it's not exactly a current source. Perhaps it's 1000 ohms, or 10000 ohms, (plus some reactance, of course) which is high but not a pure current source. Then a network that matches 1000 ohms, or 10000 ohms, to 50 ohms (and cancels the reactance), will give you the most power output. That is a linear, small-signal model, but that should be a pretty good approximation for any application where you need a low-noise preamp.

You do need to consider losses in whatever matching network you use; and many matching networks will be highly resonant to transform between impedances that are in a large ratio. Realize that the match at the operating frequency may give you a load at some other frequency which causes instability...

If the source (the output impedance) was really a current source, you could get near-infinite power gain (again, assuming that S12 is zero) by transforming the load to as high an impedance as possible. Consider the small-signal low-frequency model of a bipolar transistor where the output is a current source shunted by a resistance. Assume that (internal effective) resistance is infinite. Now the current from the current source all flows into the load. Since power is i^2*R, increasing R increases the power without bound. A matching network just transforms your practical load (e.g. 50 ohms) to the desired load R.

What's practical depends on how wide a bandwidth you want, and how good
you are at designing and building impedance matching networks. (I can
personally come up with lots of IMpractical networks! ;-)

Cheers,
Tom

Ob-flippant remark: Sure you can, you just need a negative capacitor! ;-)

I suppose if one actually built a negative capacitor out of, e.g., a gyrator,
the noise performance would be pretty much shot? Might be OK for a
transmitting antenna, though?

The effective permeability of a rod is dictated largely by the air gap in the magnetic path, which is a function of the length/diameter ratio of the rod. Powdered iron in general has very low permeability compared to ferrite. If you really wanted to apply a huge amount of power to a rod antenna, powdered iron might be a better choice because of its high saturation flux density. But I doubt you could get the Q of a ferrite rod antenna at the frequency in question, so it would be considerably less efficient. You'd probably end up with less power radiated than if you ran less power to a ferrite rod antenna, and a less efficient antenna would impact your received signal. You'd have to crunch some numbers or make measurements to find out for sure.

>> 2. You're not likely to drive either one into a nonlinear region when

>> magnetic path.
>
> Can you explain this more detailed Ron? What will happen with the air gap?
> The losses in the air gap radiates and that is the antenna function?

The presence of even a small air gap has the effect of reducing the effective permeability of the core and therefore the inductance of the winding. It also dramatically reduces the core flux density for a given number of winding amp-turns. This makes it very hard to saturate. Inductors used for power applications commonly have a small core gap for this reason. A rod has a very large air gap in the path -- from one end of the rod, curving around outside the rod, to the other. And for many ferrites used at radio frequency, the material loss is high enough that the core would be hot enough to explode well before you reach a flux level anywhere close to saturation. This isn't true of all materials at all frequencies, of course.

The radiation takes place from the field outside the core, i.e., in the air gap. If you didn't have a gap, you wouldn't have any significant radiation.

And it's Roy, not Ron.

Thanks again Tom, you've really cleared things up for me here.

Here's the concrete numbers... in the center of the band, S22 -- converted back to an impedance -- is 119.5-j90 ohms. With a 2V source, if I conjugate match my 50 ohm load obviously I get 1V across the resistor or 20mW = 13dBm. Without a match... let's see... current around the loop is 2/(119.5-j90+50) = 9.2+j4.89 mA, and power in the 50 ohm load is I^2*R = 3.04+j4.5mW = (looking just at real power) 4.83dBm. So... without a match... I'd be leaving 13-4.83 = 8.18dB of gain "on the floor"... ouch!

The problem is to pump enough energy in the air to overcome the atmospheric noise seen by the receiver.

BTW: The mentioned antenna array picture is NOT the DCF77 sender. DCF77 is exactly two antennas there only. And they have a very good performance thanks to there big outline. They radiate about 30KW out of the 50KW output power of the final amplifier. If I get 1% performance I think I'm good.

I'm not so theory funded to explain why a gap in the core transmits
electromagnetic wave. That is an open question for me.
I even don't understand why a ferrite rod will accumulate magnetic field
lines. There is the explanation of "shorten" the field lines way. Some
mysterical!

If you talk about explosion: What is the power level you mean?
Currently I have a ferrite rod of 9mm diameter and 50mm length, driven by
40mA against 2Vpp.
Do you think it is impossible to pump maybe 5watts into the rod?

- Henry

To chime in late: typically the routine in LNA design is noise match at the input, then conjugate match at the output considering the effects of the noise match. Really the only reason to play games with the input noise match is either for broadbanding or to address a specific stability issue, which usually is better handled by judicious feedback.

Dunno. If it had to dissipate most of the 5 watts (which is likely), it would get as hot as a resistor that size dissipating the same power, and that would be pretty hot. Just how hot depends on how well insulated it is, how good the air flow is around it, and how much heat is conducted away through the wires or any other physical connection. The first thing I'd check would be the Curie temperature of the ferrite. If you reach that temperature, the material will lose its magnetic properties, so the antenna impedance will abruptly and dramatically change. At some higher temperature, the ferrite will fracture, maybe violently.

If that gets to be a problem, a lower loss ferrite might be necessary. That usually means lower initial permeability, and probably a lower Q inductor. You'll have to determine what the optimum trade would be.

Shouldn't be any trick to feed some power to one and watch its temperature with a thermocouple.

Hi Folks, I have a need for the circuit diagram of the crystal
timebase oscillator for the DSI 5600A frequency counter. I have
diagrams of the main board and the display board but, as Murphys law
states, the fault is in the bit I don't have the diagrams for. Any
help appreciated.
Thanks, Mike G8NXD

When listening at the signal e.g. through an SSB receiver, it is quite easy to know the difference. The equipment noise is more or less constant "hiss", while the band noise is mainly through numerous distant lightnings.

Some field strength measurements made in England at 73 kHz during the summer, using a calibrated meter indicated 25 uV/m in 200 Hz bandwidth, which would produce about 120 dB more power from a full sized (2 km) dipole than a single matched resistor at the receiver input.

Thus, even if the actual antenna efficiency was -100 dB and the LNA noise figure as bad as 10 dB, the band noise would still be stronger than the amplifier noise.

While an antenna with -100 dB gain would be usable for receiving, such antenna would be useless for transmitting.

My receiver bandwidth is about 10Hz because of the 77.5KHz quartz crystal filter. So the sensitivity is better. Is 10*lg(200/10) here correct?

>
> Thus, even if the actual antenna efficiency was -100 dB and the LNA

It is interesting to learn, that antennas can be noise limited. So reciprocal theorem is not all to know.

Thanks -

Henry

Hello Roy -

I will try your suggestions when I build a more powerful power amp.

As the modulation is AM with known 25% there is a interesting measurement methode possible:
Ramp the amplifier from low to high power and make a curve of the AM modulation depth at the receiver or just with a measurement coil at the transmitter ferrite rod. It should show a saturation if the ferrite goes in saturation. I will try this.
There is an open question what a time constant the ferrite will have if it goes into saturation or out of it. And if this is very different if iron

powder is used.

- Henry

>
> ---Joel

OK, things aren't quite as bad as you've painted them, Joel. Given the analysis you did for the second half, what you need to do for the first half is to look at the power delivered to 119.5 ohms with 1 volt across it. That's 1/119.5 watts, or about 8.4 milliwatts. That's about +9.23dBm That's the maximum power you can get from that source. Into 50 ohms with no matching, the magnitude of the current is 10.42mA. The resistor does NOT care what phase angle relative to your arbitrary reference that is. So the power in that case is 5.43mW, or +7.35dBm. You've left not 8dB, but just under 2dB, of gain "on the floor." Things don't get really bad till the mismatch is quite a bit worse than that. Note that your 2dB occurs with an SWR of about 4:1. At 2:1 SWR, you only lose half a dB.

Cheers,
Tom

Hi,
I need to design an AM transmitter as a vlsi project (it needs to be
located on smart dust later on).
Does anyone have any good suggestions were to start from? I am familiar
with vlsi, but don't really know how to implement such a big idea, into
a vlsi simulation and circuit design.
Looking on trasmitter's schemes didn't help, 'cause that's all
resistors, amplifiers and capacitors. How do I translate it into vlsi
design?
Be very glad to any guidance...
Thanks.

The definition I've always heard for class C is that conduction of the
active device is for less than half of each cycle. Nothing is said
about saturation.

Of course, if the active device conducts when there is appreciable voltage across it, it will dissipate more power than if it were conducting the same current at lower voltage.

Cheers,
Tom

Suitable for WHAT? You say you "need" them, but what exactly causes that need? What are you trying to accomplish?

Cheers,

Tom

There is no such thing as a single core type suitable for "general" HF use, because the required core material depends strongly on just what the use is.

You can, however, satisfy a large number of requirements with a few core types. Micrometals type 2 or 6 powdered iron cores are suitable for most high-Q inductors. I consistently measure higher Q with type 6 cores, at least when sparsely wound, but type 2 is convenient for higher inductances due to its higher permeability. I didn't know Philips made powdered iron cores -- if they do, you should check their web site and Micrometals' to find an approximate equivalent. The choice of core material for RF chokes and broadband transformers depends on how much power and how much DC current is involved. For low power applications where there isn't a substantial amount of DC current, Fair-rite type 43 ferrite material is a good choice for those applications. If you need more impedance, for example at lower frequency or in higher impedance circuits, one of the 70 series materials would be better. Again, look at the respective web sites to find an approximate equivalent material from another manufacturer.

The sizes of cores you'll need depends on the inductance (for high-Q inductors) or impedance (for RF chokes or broadband transformers) range, power handling capability, and DC flux level you need to deal with. For low power, low flux applications, (F)T-37 and -50 are popular sizes. These are 0.37 and 0.50 inch OD respectively.

```

Look at it this way: If you had to drive the device into saturation before it was class C, then there could have been no class C tube amplifiers -- yet I see schematics for them all over my older amateur radio literature.

The definition that _I_ was taught was all about conduction angle.

> I checked back with SSDRA and EMRFD, and didn't see anything about
> driving Class C amps into saturation?
> What says the group? Do we saturate in Class C or not?
> --
> I've been thinking about this some more. The 1980 ARRL handbook points out that "Solid State power amplifiers should be operated just below their saturation points for best efficiency and stability." Also, the formula that we use to determine load resistance (Rl=Vcc^2/2Po) implies that we are looking for a combination of Vcc, Load resistance and power out that will prevent saturation.
> And wouldn't we end up with far lower harmonic content if we only clip one side of the wave form (at cutoff) instead of both sides (cutoff and saturation)?
>
> I know there are more exotic modes beyond C, but for plain old ordinary ham radio applications, don't we normally avoid saturation in Class C amps?

The "saturation" in bipolar transistor terminology means "current saturation", but it could just as well mean "carrier saturation". When the transistor is saturated the base region is stuffed full of carriers (holes, for an NPN transistor). It takes a while for those carriers to go away, during which the transistor stays on. This is a very nonlinear effect, and can be very slow. The old 74Sxx series logic put a schottkey diode from collector to base on the transistors to keep them out of saturation, and sped them up considerably.

So yes, with an otherwise ordinary bipolar transistor you probably want to avoid saturation.

>
> Also, what about this business of having the efficiency improve through saturation "because the saturation voltage is low" Could that be right? If you put a voltage across a conductor and generate a large current, you can't sit back and say "Great! Power consumption across the conductor is low because the voltage drop across it is now minimal!"

That's the whole point of the class D amplifier (AKA switching amp, or switching supply) at baseband, and the class E amplifier at RF -- you arrange the circuit so the transistor is either on with low voltage across it, or off with no current, with as little time in between as you can manage.

But it's not class C, or at least it isn't _just_ class C.

I don't think you could manage a class E amplifier with bipolar transistors at RF frequencies, although I'm willing to be surprised.

Thanks for the answers.. I already didn't say that i needed one exact type. They will be used in HF transceiver projects(ie. VFO's, mixers, BPF's and everything). I think that a toroid like T-50-2 would be useful for many applications like those. As i said above i only have access to Philips cores and i can't find a catalog to choose from. I did a search on the net but didn't come accross anything handy. So if any of you have used Philips cores in your applications i would like to know what types do you use and what equivalents are out there for known brands such as Amidon, CWS etc.

Thanks...

No, but I asked them to start testing on PSK, RTTY, APRS, Computer Interface Logic and Theory and a half dozen other digital points. Does that help?

The Philips cores that you are referring to were probably manufactured
by Ferroxcube (Philips has sold the company to Yaego). You can find
data and a handbook at http://www.ferroxcube.com/

If you want a useful ham program (free) for designing with Ferroxcube,
Amidon, Epcos and air cores download "mini-RC Calculator" from
http://www.dl5swb.de/html/software_for_amateur_radio.htm

Fair-rite (ferrite manufacturer) has a distributor in your country -
Turkey and they can be contacted at http://www.aktif-neser.com/

The very slow saturation recovery you see in saturated switch applications (unless using a gold-doped transistor) is largely absent in typical RF power applications. The reason is the bipolar drive usually employed -- there's typically a large amount of negative base current available to suck the stored charge out of the base region in a hurry.

2 each   Cardwell 50 x 300 mmfd 3/16" between opposing plates.
14.5" from front end of shaft to rearmost.
The other dimensions are 6" x 4"
Neither looks used.
Shipping weight is m10 pounds.
One has had the insulating strip on one lower side repaired.

(This strip is not load bearing - has terminals on it)
Price for the repaired one $25 plus shipping from near Sacramento, CA
Price for the other is $30   plus shipping from near Sacramento,CA
http://www.muchstuff.com/pics/VARCAP/VARCAP-1.JPG
http://www.muchstuff.com/pics/VARCAP/VARCAP-2.JPG
****

One National Dual variable capacitor. 10 to 50 mmfd each section.
Common rotor. 3/8 inch between opposing plates.
With ceramic flex coupler on end of shaft.
13" from end of shaft to rearmost. Other dimensions 5" x 8"
Looks unused.
I don't know what happened to the pictures. I will try to take pictures again tomorrow, but please don't wait on that.
$40 plus shipping from near Sacramento, CA.

PayPal, or,
Credit cards through PayPal,
or, Checks to me

These will be shipped by USPS at the Bound Printed Matter rate, paid by buyer.
These are in good to very good condition, unless stated otherwise.
The units listed are the groupings by which they will be sold.
I may not reply to requests for parts of the groups.
When you first order please tell me your address with zip, so I can tell you what the shipping will cost.
I'm done for the night. I will pick up responses tomorrow

This batch of tubes consists of mostly old home radio type, with a few audio and transmitting types.

PRICES ARE MOSTLY BETWEEN 65% and 75% OFF OF INTERNET TUBE DEALERS

Shipping in USA is a flat $4.00 for whatever amount shipped at one time.
Payment by PayPal, or Credit cards through PayPal, or checks to me.
Any shipments outside of USA will be paid through PayPal only.
I will only ship big orders outside of USA.   That's big in money.

See them at:
http://www.muchstuff.com/1024tfs.html

The fractions indicate how they tested on the tube checker. The numerator is the scale reading, the denominator is the amount on the chart. The checkers were either my Hickok 6000A or my TV7/U. The tubes may or may not have boxes. If they are new, then they are in boxes.
N = new. U = used.   Tip = glass comes with a tip on top.
BB = brass base. A round glass is like a tennis ball is called ball.
A glass that is larger at the top (like a 280) than at the base is called ballon.

Please email your orders including the full description, that is tube type followed
by the TCxxx number which tells me where to find it.
Please, I am not going to pull these tubes to look for more descriptions; like getter shapes and plate colors.

news:lO93h.2461$0r.1796@newsread1.news.pas.earthlink.net...
If all the seats are taken at a club meeting and a 20wpm code tested Extra
is standing, a no-code ham should give their seat to the Extra and sit
on the floor. After saluting of course.

SC

Not only should the No-Coder give up his seat to a superior, he should also
wipe it clean with disinfectant.

A hard limiter decreases the signal to noise by about 5.6 db, and
that's a mathematical fact...

Andy,

Can you point us to a reference document that explains this "mathematical
fact"?.

Joe

Andy writes:

No. It was about 25 years ago when I was designing the TI2100 FM
Marine
Transceiver for Texas Intruments, which was my last commercial Fm
unit. (Some two meter stuff since then as home projects, tho)

It was info gleaned from several technical papers and I don't for
the
life of me remember which ones. I got a limiter and noise source
and checked it in the lab, at the time, and it seemed consistent.
I don't remember exactly, but I think I combined noise with a
signal and amplified the hell out of it, and then put in an
attenuator to get it back down and measured the S/n in a receiver.
Then I put a limiter in between the amp and the attenuator, and
decreased the atten to get the same level into the receiver, and
measured the S/N again. While I didn't get exactly 5.6 db, I
remember it was close enough to believe that the mathematical
derivation was confirmed (in my mind) and that my measurement
error was probly due to my own imprecision in the experiment..
Anyway, I moved on..... and it settled the question on whether
hard limiting "improves" things.....

Sorry, but that's just one of the numbers that stay with a guy, like
-174 dbm (God's noise) , and 8.5 db (tangential sensitivity), and
10Log(bw), and 3.14..... Heck, I forget my phone number from time
to time, but numbers that I have used for most of my life stay with
me.....

And, being in the profession, I have, at some time or another,
verified
them myself in the lab when the opportunity permitted.. I take that
back.... I have never verified PI....... I hope I haven't been too
gullible..... :>)))

So, I regret not having the mental acuity any more to jot down some
derivations for you. But , if they are not correct, there's a lot of
products

on the market which I built whose development was a wild fluke....

If you want to pursue it yourself, I would suggest a few texts that have guided me... Skolnik's Radar Handbook (the smal one, not the BIG one --- I call it " small Skolnik") has a LOT of tech info that is presented in a level only slightly greater than the ARRL handbook. Also "Principles of FM" -- damn, I don't remember the author.....but how many could there be ? :>)))) I might have it in my workshop. If I run across it I'll post it here.

Well, good luck. Some knowledge can be passed on as a proven fact and one needs look no farther..... like PI, for instance... Other is in conflict with what someone thinks to be "how things work", and doubt is in the air.... No matter -- I was the same way, when I had the energy to pursue it.....

Good on ya' , mate,

Andy W4OAH in Eureka, Texas

So it's not a "mathematical fact" in the sense that any of us can look it up
and see how it was derived, it's your recollection of something you heard
and vaguely remember convincing yourself it could be true, right?

While we're at it, what's the significance of your reference to "8.5 db (
tangential sensitivity)"?

Joe
W3JDR

Agilent App Note says:

Tangential sensitivity is the lowest input signal power level for which the detector will have an 8 dB signal-to-noise ratio at the output of a test video amplifier.

As far as I'm concerned... saturation has nothing to do with the class the amplifier is running. I can saturate an amplifier in any class. Saturation is most ofen an undesireable effect... that causes distortion in amplifiers.

I checked Fair-rite's site but couldn't find anything about frequency characteristics of toroidal cores. Also, you know, as a homebrewer i can't buy parcels of material like toroids, and I don't think that distributor can sell small number of items, can they? Anyway, doesn't anyone use Philips toroids, or is there no such thing as Philips cores?

Thanks...

------------ REPLY FOLLOWS ------------

Saturation is only undesirable in LINEAR amplifiers. In non-linear amps which are often used for CW, RTTY or FM, saturation is good because it improves efficiency. Distortion in those applications is unimportant.

Philips is no longer in the ferrite business!! They sold the company to Yaego and it now operates as Ferroxcube. The Philips cores in your area must be available as surplus parts. Use google "Philips Components Magnetics" and you will find old spec sheets.

You can find current toroid data and a handbook at http://www.ferroxcube.com/ They have kept some of the Philips part numbers.

More toroid info at
http://www.electronics-tutorials.com/basics/toroids.htm and
http://users.catchnet.com.au/~rjandusimports/

Did you download "mini-RC Calculator" ???
www.dl5swb.de/html/software_for_amateur_radio.htm

This program will answer many of your questions.

Roger

A friend who was in the TV repair business for many years has given me a large bag of transistors in little plastic squares marked
Magnavox factory replacement part and then a serial number. They are all different and I would love to know what their equivalents are. Is there a site or any way of getting this information? Thanks.

Andy W1AWB

Andy writes:

I used 8.5 db, tho , as you know, it has a LOT to do with who is making the measurement and positioning the pulse on the scope....
I'm not sure that I am proficient enough to position an 8db pedestal to within a half db accuracy...... Agilent probly used a math derivation.
I have seen it called out at several numbers, tho 8.5 is the one I always used....

I will probly start using 8 db if the Agilent App note says so since there is always somebody wanting to get a "reference", and it's much easier to just give them the App Note source than try to explain....
Once they actually see the scope presentation, they will understand the problem...

Andy replies:
That's right. But just because I don't remember how to derive it, or can give you the name of the paper that I read 25-30 years ago, it doesn't mean it's wrong. So I would suggest you do your own research....

Whether it is true, or not true, IS a mathematical fact, and if you are capable of understanding the math proof, you are probably also capable of proving or disproving it yourself on paper. Me, hell , I always had a good lab where I could try things out if I had doubt.....

It is probly easier, if you have access to a good lab, to rig up an experiment to find out..... That way you wouldn't have to bother with newsgroups to learn about this stuff.....

I would encourage you to try. If you come up with a good answer you can be proud of, post it back here for us all to see. I am sure many people here would be interested , since lots of time is often wasted coming up with circuits whose purpose is doomed from the start.... such as using "hard limiters" to improve the SNR........

As far as the "tangential sensitivity", you can probly do a google search and learn all about it.... If you haven't run into it yet, you probably don't deal with OOK pulses like radar and stuff. There's no shame in that.....

Andy writes

Well, I saved you some time by googling it myself. It took about 10 seconds
to be able to cut and paste the definition I have been talking about....

Note that in this paper it says TSS is eight db +/- one db ....
and depends on several system factors, including the
actual detector used... From experience, the detector type,
and the absolute signal level it is detecting, is a BIG DEAL.
It needs to operate in the "perfect diode" region . Doing the
detection in the square law region buggers up the measurement.

That +/- one db is due to the accuracy that one operator can set up the
scope versus the next operator that comes along. I use 8.5 db, and
I DARE anyone to set the same measurement up 10 times in a row and
get the same answer to less than +/- one db.

Agilent probly uses a math derivation to get 8 db to accomplish
some specific criteria, and did not specify a detector type, hence
it is a "mathematically perfect " answer. Furthermore, they use a different
definition, but ORIGINALLY it was bases on the FIRST SENTENCE in
the cut and paste below...

The Agilent App Note that Bill Sabin refers to also came up on the first page of hits, and you can go read it for yourself.

I hope this satisfies your curiousity. I had nothing better to do today..... Now, I'm outta beer, and Jeff Foxworthy is on TV, so 73s

Andy W40AH

***********CUT AND PASTE FROM GOOGLE HIT *************************

TANGENTIAL SENSITIVITY

Tangential sensitivity (TSS) is the point where thetop of the noise level with no signal applied is level with thebottom of the noise level on a pulse as shown in Figure 6.

Itcan be determined in the laboratory by varying the amplitudeof the input pulse until the stated criterion is reached, or byvarious approximation formulas.The signal power is nominally 8=B11 dB above thenoise level at the TSS point. TSS depends on the RFbandwidth, the video bandwidth, the noise figure, and the detector characteristic.

TSS is generally a characteristic associated with receivers (or RWRs), however the TSS does not necessarilyprovide a criterion for properly setting the detection threshold. If the threshold is set to TSS, then the false alarm rate israther high.

Radars do not operate at TSS. Most require a more positive S/N for track (> 10 dB) to reduce false detectionon noise spikes.

SENSITIVITY CONCLUSION

When all factors effecting system sensitivity are considered, the designer has little flexibility in the choice ofreceiver parameters. Rather, the performance requirements dictate the limit of sensitivity which can be implemented by theEW receiver.1. Minimum Signal-to-Noise Ratio (S/N) - Set by the accuracy which you want to measure signal parameters and by thefalse alarm requirements.2. Total Receiver Noise Figure (NF) - Set by available technology and system constraints for RF front end performance.3. Equivalent Noise Bandwidth (B) - Set by minimum pulse width or maximum modulation bandwidth needed toNaccomplish the system requirements. A choice which is available to the designer is the relationship of pre- (B) and post-IFdetection (B) bandwidth. The most affordable approach is to set the post-detection filter equal to the reciprocal of theVminimum pulse width, then choose the pre-detection passband to be as wide as the background interference environmentwill allow. Recent studies suggest that pre-detection bandwidths in excess of 100 MHz will allow significant loss of signalsdue to "pulse-on-pulse" conditions. 4. Antenna Gain (G) - Set by the needed instantaneous FOV needed to support the system time to intercept requirements.

I didn't think of that -- in spite of having applied it in a small switching regulator application, per an ap note by Zetex.

D'oh.

Thanks for pointing it out -- perhaps I'll remember this second application. Perhaps when the third one comes around I'll put one and one together...

???

On the main page, under "Technical Articles", "Use of Ferrites in Broadband Transformers" has a large amount of information about frequency characteristics. So does "How to Choose Ferrite Components for EMI Suppression".

> Also, you know, as a homebrewer i
> can't buy parcels of material like toroids, and I don't think that

I'm puzzled. . . does Philips sell small numbers of cores directly either? I'm sure some of the folks here can recommend retailers who sell a small number of cores from various manufacturers. The last time I checked -- some time ago -- Amidon was still selling Micrometals powdered iron cores and ferrites from Fair-rite and Magnetics.

There are so many variables and approximations involved that it would seem difficult to be very precise about 8.0 or 8.5 dB S/N ratio or some other number. The decision probably involves the type of signal involved. 8.0 dB in one application gives the minimum acceptible performance for one kind of signal. A more critical system might want more than 8.0 dB to achieve a better bit error rate, for example.

=================================
In the UK there are quite a number of small retailers which can supply
ferrite as well as powder iron cores.
www.sycom.co.uk
www.jabdog.com
www.modecomponents.co.uk

Also the G-QRP club sells both types of cores to members.

Andy comments:

Yeah, ... the way I used it was to adjust the level to tangential, then increase the signal level with an attenuator to get the S/n I wanted,,,,,

You know how hard it is to put together the stuff to measure the S/N of a pulsed signal ? Well, by setting it up to get 'tangential" then messing with the attenuators to get what I wanted, I could, with reasonable accuracy, set up a measurement for 13 o 14 db S/n , or whatever, to take the Pfa measurement....

(Those are the S/N levels that reasonable Pfa and Pd numbers occur)

Remember, Tangential Sensitivity was defined 50 years before
Agilent
was in existence... Maybe more....... It allowed a person with a scope
to
make reasonably accurate measurements, and refine their systems to take
advantage of it, 50 years before the simulators, and math, dealt
conclusively
with the issue. Hewlitt was using light bulbs to make audio
oscillators when
RADAR engineers were finding German airplanes....

If my use of the HISTORICAL term has confused these kids that just
got
their BSEE,...... I don't really care....

Why do we respond to these kids ? Probably because we both are
retired and bored.....If they want to prove we are stupid, ...
hell,.... it's
OK with me..... I admit readily to having only a fraction of the math
ability
that I would need to understand all of the things I know to be true...
.... Including Pi.............

Andy in Eureka, W4OAH, over-the-hill on Lake Richland-Chambers

Don't worry about saturation. CB'ers think over saturation produces
a better sounding signal. Of course, on ham radio we would call
them Lids.

It can be messy. The class of amplifier is determined by the cut-off (or lack thereof). A class A amplifier neither hits saturation nor hits cut-off. Maximum theoretical efficiency (of a sinusodal waveform) of a class A amp is 50%, but 25% is typical. Very low distortion, of course.

Class B amplifiers are biased at cutoff and only conduct for 50% of the cycle. They shouldn't saturate, however. Efficiencies are around 60%.

Class C amps are typically biased well into cut-off and only conduct for perhaps 90 degrees (25%) of the cycle and can run 70% efficient.

However, there are class D and E amplifiers and they are switchmode amplifiers. They run on or off (cut off or in full saturation). They are normally used for CW or FM and there was a circuit (and components) available from a university to build a cw transmitter using switchmode. The thing ran about 93% efficient!

To add to the confusion, with solid state it *is* possible to use the darn things as a *linear* amplifier! Yep, commercial radio stations now use these things. The problem is that the control circuitry (which, I believe, controls the voltage fed to the final) is very complex and expensive and will be found neither in amateur nor cb equipment for a long time.

Why is this so difficult? Just consider what an AM signal is. Please note that Motorola and I'm sure others have made analog AM transmitter chips beginning a long time ago; they are not "VLSI" by any means. If you'd like to do it more digitally, have a look at the offerings from folk like Analog Devices. Look at their line of TxDACs. Inside some of those chips, you'll find everything you need to make an AM transmitter, given a stream of words representing the modulation you want to apply, and then some.

Is "VLSI" compatible with "smart dust"? Is the power dissipation of a universal all-digital solution compatible with "smart dust"?

You might do well to first list some of the key requirements: output power, size, carrier frequency, modulation bandwidth...

Cheers,
Tom

Hi Mike,

Good luck. I just pulled out my manual, it's an original, and like you say, there's no info at all on the 10mc timebase ossc. exc. that it's "ovenized" and takes 9vdc & (I think) 5vdc inputs, and puts out 10mc. I got mine used at a hamfest probably 15 yrs ago, it was built as a kit, looking at the marks in the manual. It's worked for me since, after I did something (can't remember what) in repair.

Hi, Everybody,

I am interested to hear how you have solved the problem of panel-mounting
Anderson Powerpole connectors.

I have already ruled out the Anderson 4-pole "Powerpole Pak" connectors. Too
bulky. Don't need four. Just need two. I know about these. I am interested
in other solutions.

Thanks very much.

Regards,

Al W6LX

yep or that he does and that is why he refuses to give out his call
althought frankly I become increasing persaded that his call is K4YZ

Oh, really????
How about THIS one? (QRZ) and a newstory from England?

Quote
Morse code used in rescue!

London, 20 October/GNN/ -- MARITIME AND COASTGUARD AGENCY News Release (Press Notice: 368_06) issued by The Government News Network on 20 October 2006

Yesterday afternoon just after 5.30pm Hayling Island Coastguard team member, Steve Mann, witnessed what he thought was a SOS message flashed by torchlight towards the Control Tower at Hayling Island Sailing Club. Steve responded to the SOS message by switching the lights on and off in the Control Tower.

The casualty was identified and was indeed using Morse code as he had recently transferred all of his safety equipment from his 28ft fishing vessel onto a newly acquired boat. He was running this vessel from Emsworth to Thorneham Marina, a distance of about 4 miles, when he ran aground and started to take on water. Steve Mann then alerted Solent Coastguard Marine Rescue Coordination Centre who requested the launch of the RNLI inshore and D-class lifeboats from Hayling island to the casualty who was transferred to Hayling Island Lifeboat Station, where he was checked over by a crewman who is also a paramedic. His vessel was towed back to Sparks Marina by the inshore lifeboat.

Steve Mann said afterwards, "I was absolutely amazed to see the flashed SOS message. This man was caught out on the one occasion he went to sea with absolutely no safety equipment. Even without radio communication going to sea without even a portable flare is extremely dangerous and could cost you your life."

Apologies for asking...
Please explain vlsi and smart dust to a newbie.

Thanks for taking the time.

Please look up "cross posting" on Wikipedia, and note what they have to
say about "multiple posting".

Then if you feel the need to cross post (which would have been
appropriate here), do so.

I would bet that the person flashing SOS knows little, or no morse code other
than SOS.

This, as an argument for hams using CW, is kind of like "mayday" being an
argument for hams being conversant in French.

Hi fellows!

I'm building a software defined radio that is mostly based on the "Software Defined Radios For The Masses" -articles and are at the point of designing the DDS board. I have two units of AD9954 DDS chips and my idea was to use them parallel, other one with 90 degree phase shift to generate the quadrature signal. This is my first time with DDS, so understanding the control seem to be a little bit difficult for a first timer.

Two questions to start with:

1. I suppose for proper control I need four pins connected from the DDS to the computer (through buffers) I/O update, SDIO, SCLK and Reset, am I correct?

2. Do I have to drive two SDIO serial signals separately for each DDS chip from computer so, that I can define the phase shift for the other DDS (while other one has no phase shift, obivously) ? This came to my mind since the chips don't have any addresses to indentify them.

Thanks a lot!!!

Joel Kolstad wrote:

> On a reciever, I'm using a MMIC LNA at VHF

Andy writes:

Joel, all of the advice I've read on this post is good advice, but I didn't see any reference to the Linville or Stern stability factors.

Devices, ESPECIALLY at VHF, which are matched into source and load often oscillate. Hell, they USUALLY oscillate. Hence , S12 is a major factor in these designs....

Most of the time, devices in this range must be mismatched to some degree to provide stability.

Motorola used to have an excellent App Note on amplifier matching, and the degree of mis-matching to ensure stability It was called " Effects of Y parameters" or " Calculating Stability in... " or some such, and the number was in the 100s or 200s.

If you know the Sparamters (or Y parameters, for the app note) you can easily do a Linville on the numbers to see if the LNA is unconditionally stable for all source and loads.....

It probly won't be.....

Then, you can do a Stern to see what degree of mismatching is needed to just reach the stability threshold.... If you program the equations into a computer (I use BASIC but an EXCEL spreadsheet will work well also) you can quickly decide what you want to do. Note that the amplifier configuration is the source of the parameters and not just the device. For instance, common base is often unconditionally stable while common emitter more often than not is never unconditionally stable. The S or Y parameters for the amp in these configurations show it when a Linville is applied.

It may be that optimum noise figure can't be reached with unconditional stability...... so you just do the best you can....... Personally, I've always found the best noise figure while diddling the circuit, rather than calculating it..... but that's just my own experience...

Good luck on your design. And don't get so hung up on this "maximum power transfer Thevin" stuff, since any amplifier that is Thevenin matched on it's output could only achieve 50% efficiency, and most amplifiers do a lot better than that...... for the simple reason that max power transfer isn't the main goal of an amplifier.....

Can you cut a rectangular hole in the panel, slip the Powerpole
connector through (far enough so you can connect its mating plug) and
use a glob of epoxy on the back side to hold the plug to the backside of
the panel?

Anyone have any sites or information on either PIN diode or reed relay fast switching for my 150W SS homebrew HF amp?
Found a few through Google but thought some of you might have already done this.

Tnx,
Dale W4OP

Lots of good input there, Andy; I appaeciate it.

The part in question claims it is stable working into and from 50 ohms; I do put too much emphasis on matching to that somewhat arbitrary value at times.

Think "nanites" from Star Trek: The Borg Generation.

See: http://en.wikipedia.org/wiki/Smart_dust

It's a popular research topic these days, but as far as I'm aware all the commercial applications are still nowhere near the "grain of rice" size that the proponents would like to achieve -- power sources become a real problem at that size, even if you only do need to communicate with the next node that's only, say, 10' away.

Oh... VLSI is "very large scale integration." It just indicates an IC that has "[mumble]-many million transistor," where the actual number is subjective. A 32 bit CPU is VLSI, a 74LS00 ain't.

```

> needed to just reach the stability threshold.... If you program the equations into a computer (I use BASIC but an EXCEL spreadsheet will work well also) you can quickly decide what you want to do. Note that the amplifier configuration is the source of the parameters and not just the device. For instance, common base is often unconditionally stable while common emitter more often than not is never unconditionally stable. The S or Y parameters for the amp in these configurations show it when a Linville is applied.
>
> It may be that optimum noise figure can't be reached with unconditional stability...... so you just do the best you can....... Personally, I've always found the best noise figure while diddling the circuit, rather than calculating it..... but that's just my own experience...
>
>
> Good luck on your design. And don't get so hung up on this "maximum power transfer Thevin" stuff, since any amplifier that is Thevenin matched on it's output could only achieve 50% efficiency, and most amplifiers do a lot better than that...... for the simple reason that max power transfer isn't the main goal of an amplifier.....
>
> Andy W4OAH in Eureka, Texas

Note that the free RFSim99 can display stability circles on the Smith chart display of S11 and S22. They change as you move the cursor frequency, and redraw quickly so it's easy to check over a frequency range.

I don't know why the myth persists that you can achieve no more than 50% efficiency if a load is matched to the source impedance. A Thevenin-equivalent source does not necessarily look anything like the Thevenin circuit inside; it simply behaves WITH RESPECT TO THE LOAD in the same way (over the range of loads and outputs for which it behaves linearly, since the Thevenin model is a linear one). But that's all a red herring anyway: in an LNA, "efficiency" is probably one of the LAST things you should worry about. You should worry about noise. You should worry about stability. And you should worry about distortion. You should even worry about where you'll put it in the system. All those would normally come a long ways ahead of concerns about efficiency.

Cheers,
Tom

Put its S-parameters into a two-port instantiation in RFSim99, Joel, and you can play with matching and stability to your heart's content. It won't help you directly with noise, but if the data sheet tells you about how to match the input for lowest noise, that would be at least a good starting point for the input network. I think you posted that it's an MMIC; they often don't provide as good a set of info as do "bare" transistor data sheets. NEC, for example, seem to do a good job providing data about S-parameters versus frequency and operating conditions, and about noise figure versus input matching as well.

Cheers,
Tom

Don't know that particular DDS but did it with two AD9832 used in a vector impedance arrangement. The master clock and serial clock/data lines were wired to both chips. Common serial data was sent to both chips but made 'valid' only for the wanted DDS by use of individual "Fsync"(?) lines. Worked no problem. Chips never got out of step. Phase could be varied at will.

Hi,

I am wanting to clean out some "junk" boxes of many many types of assorted parts - new, used, salvage, etc.
They're from/for Radio, TV, computer, printer, inventory buyouts, etc.

If you have any parts in mind, PLEASE let me know if in need of any. I'm planning to do some grab bags - relatively CHEAP. The only cost "I" have no control over is "shipping". Though I DO try to ship as cheap as I can and the shipper is usually up to the buyer. Insurance is required - lest you take responsibility for lost, stolen, damaged shipments.

Payments via Postal MO, Pay - Pal, Certified Bank Funds. Personal checks - allow 2 weeks to clear.

Any parts requests?

Some other things among my pile are miscellaneous gauges and colors of wire, AC line cords, hardware, etc.

Not to mention a ton of parts bought from a "closing" Radio Shack. They're going pretty cheap too - certainly cheaper than retail. You can almost get two for the price of one. I have some PC Board material as well. Most is Single sided. SPEAK UP with needs.

Thanks

Lou!

For an IF filter, I'm planning on using a an off-the-DigiKey-shelf crystal filter. I need (well, want) to match the filter to 50 ohms.

Could someone verify I'm interpreting the data sheets & terminology correctly?

Say I'm getting an ECS-10.7-7.5A filter, data sheet here:

http://www.ecsxtal.com/pdf/mono.pdf ... I'm reading the "termination impedance" as 1800 ohms in parallel with 5pF or, at 10.7MHz, 1800 || -j2975 = 1318 - j797.2 ohms. From reading the application notes on ECS's site, the idea here is that -- for the filter to work as designed -- it wants to "see" 1318 - j797.2 ohms on both the input and output, correct?

I'm also thinking that just because the filter wants to see a certain impedance doesn't necessarily imply that the filter's own internal impedance is the complex conjugate.

Thanks,
---Joel

Actually, I have held an advanced class ticket for more than 30 years.

I took my test at 1919 M Street, NW? Washington, DC. Under the watchful
eye of an FCC examiner. My code test came off of an old signal corps
paper tape driven code practice machine. The key they gave me to use was
from the same set.

My receiving speed was somewhere around 40wpm, and my sending sucks rope.
I never could master an Iambic keyer.

-Chuck

Andy writes:

Joel, whenever I put in a Xtal filter, I make a parallel tank on the input and output so I can tune the reactance of the tank to minimize the ripple in the filter. This is usually part of the source amp, anyway, and having a high Q tank on the output is only a couple more parts.

You are correct in that the filter "wants" an 1800 ohm source and load resistance. This can be achieved by impedance matching, or by termination resistors (whilch will lose a lot of your power). It is good for the entire termination to be the input of the next device, transformed up or down.

The same can be done with the source impedance. However, the source may not like the Xtal filter as a load, since, even tho you may have the transformation exactly right, the load presented to the source is very complex, and may be very high (or low) as soon as you leave the xtal filter bandpass frequency..... Consequently , I have always used a load resistor in the output of the source amplifier, either as part of the coil Q, or as a fixed value resistor ...... just to keep the load from going very very high outside of the bandpass and making the source amplifier go unstable......Sure, I lose a bit of gain, but a stable amp is more important than an extra few db of gain....

Finally, the last adjustment is made by sweeping the bandpass while diddling the input and output tuning until the flattest response is noted, or at least the response the manufacturer specifies...... I peak the response at the center of the banpass first, then sweep back and forth to get a flatter response. Usually the peaking at the center is very close, tho..and if you have no way to sweep, it will probly work well for voice type signals... With data signals, well, it just depends.....

It may be useful to build a little jig to test the filter in, using fixed resistors for source and load, and parallel tanks on both sides, just to see if the filter does what you think it does. There is

a lot of loss here, but you would only be looking for the response. If you don't have a sweeper, maybe you can just rock the generator back and forth with one hand while diddling the tanks with the other......

Good luck..

Andy W4OAH

A large increase in a receiver amplifier load impedance just outside the passband of a crystal filter (or other types of filter) can cause adjacent channel susceptibility. The network between the amplifier and the filter should be designed to prevent this occurrence. There are networks that can reverse this effect, so the impedance drops instead of increasing. Simulations and impedance measurements can verify.

Andy comments:

A good point. But I am not aware of any passive networks than
can roll the impedance off (or bring it up) fast enough to handle
the adjacent channel problem. Adjacent channels are usually
(in my experience) only a few Khz away while the xtal filter is
usually many Mhz, and a passive network just doesn't change
the impedance that quickly. For those problems, I have always
had to go to a passive resistor source, such as a collector resistor,
or use a coil with a Q low enough to provide the same effect.

If I am incorrect in this, could you please elaborate on what
passive matching circuit you are reccommending. ?

I've had enough of SC in newsgroups!

Please don't answer his flaming posts. I would like for my 14 amateur radio operator girl child (who is working on her code) to be able to use newsgroups without this abuse. We should not have to put up with it either.

Copy and forward the following to abuse@earthlink.net. They should be able to identify him from the headers and their logs.

Dear Earthlink Abuse . . .

Please get this clown off of usenet. There are several hobby groups where he posts regularly his inflammatory material, often with profanities. Our kids who are in the hobby certainly don't need to be exposed to this stuff.

Thanks.

Long time internet user and parent.

And if they fail the code test they get zapped again.

Bringing back 'spark' will be good for ham radio.

It appears to me the only profanity was directed AT Slow Code. I am sure
Earthlink will give your (anonymous) complaint the attention it
deserves. You have elevated childish whining to a new level!

You don't. Use a kill file. If you don't, you have only yourself to blame.

It;s much less expensive in the long run than screwing around with everyone's
first amendment rights.

If you have the July 1970 QST there is an article starting on page 35 that discusses this situation. The load impedance at the drain of the JFET amplifier increased very rapidly just outside the passband of the xtal filter as shown in Fig 8. The network in Fig 9A inverts the impedance change as shown in Fig 9B. This approach was tested for this article. Pages 39 and 40 show the text that applies to this situation. I have confirmed this approach a few times since then. However, if a fixed resistor is used to load the drain of the JFET this effect is pretty well mitigated. A large increase in the load impedance that the amplifier transistor sees can cause the JFET drain to become overloaded just outside the passband, and I confirmed this in a homebrew receiver that used a particular xtal filter. Different filter design approaches (xtal filter black magic) might produce results somewhat different than mine, so the problem and the solution always need to be verified experimentally. In general the gain of the JFET etc. must be restricted so that drain overload is avoided at all frequencies, as the article explains. Also, if you have the 2004 ARRL Handbook, page 17.5 column one mentions a similar problem that can occur.

I dying to know how you make out. Here's why:
I have some DDSs, AD9911, I can't get to do anything. They have the
same I/O lines: I/O update, Reset, SDIOs and SCLK. I used a BasicStamp
to control it: Reset high, SCLK it, send in data on SDIO line, then
pulse IO_Update, nothing. Used a 10 Mhz system clock from an HP
generator. Though my one problem is the AD9911 I/Os are 3.3 volts, so
I used resistor divider on the uController outputs to the AD9911 to
drop the level, maybe that has something to do with it, I'm waiting
for 3.3 - 5 v level shiftrs from Maxim to come, MAX3371.

OTOH I strongly suggest that your 14 year old is kept in ignorance
of Usenet until she chooses, as an adult, to venture into it. My 14
year old boy has access to web based groups and I know what they

are. One of the advantages of running a home network is having some control!

As to the world being hostile at times, I'm sure that your 14 year old has already worked that out and doesn't need to be exposed to the abusive behaviour and language that is so common on Usenet!

Thank the lord for kill files :)

Charlie.

Once you master the electronic key you'll wonder how you ever got by without one. I used a straight key for years and then got an electronic one. It made code more fun. I tried a bug once, but after using the electronic key I lost my timing on the side to side stuff.

One thing for sure in the maritime story above, someone did know morse, and the rescuers probably weren't going to wait for a full message after the sos. they would start the rescue right away, they didn't need to see a message.

SC

Whaaaaaaaaaaaa!!

Have you ever sat on the toilet and tried to fart your callsign in
morse code?

You're so wound up, I bet you could fart your call at a nearly
perfect 1000Hz square wave.

Al-

I don't recall where I saw it, but there was an article about using the connectors that West Mountain Radio uses in their RigRunners. As I recall, the pair were soldered to a small circuit board and mounted behind a cut-out in the panel. If you can look at one of the RigRunners, it should be possible to figure out how to do it. The only problem is finding that version of the connectors. I'd try West Mountain Radio first.

I understand at least one Ham transceiver has been produced, possibly a Yaesu, with the pair mounted on the rear panel.

73,
Fred

Looking for suggestions for a good crimp tool for installing coax
connectors. It will primarily for BNC connectors on RG-174, 58 and 59
cables. Although the RG-8 cable family capability would be nice too.

I do wish to avoid being a captive customer in that brand X crimp tool
only works well with brand X connectors.

And, of course, looking for the best bang for the buck.

Thanks,

Danny

My take is that the best possible bang for the buck, as it were, may be had by searching Greed-bay for a surplus mil-spec hex crimper, such as the Daniels Manufacturing HX-4. This particular tool has interchangeable dies to accommodate a wide variety of coaxial connectors, as well as insulated terminal lugs.

They will tend to be more expensive, even at the surplus level, than your typical made-in-taiwan Paladin (or whoever) crimper, but the Daniels tools will also be of a much higher quality. Properly cared for, they may outlast their owner.

As some examples: Item #120044919904 is for a new HX-4 frame, in its original box, with a Y193 die set, opening bid of $79. Considering that the frame alone new, from Daniels, is nearly $280, that's quite a bargain.

Granted, the Y193 die set won't be useful to you unless you're crimping contact assemblies for the D-sub coax/regular combo connectors, but it should not be hard to find appropriate die sets for whatever connectors you want to work with.

A full description of the HX-4, and a listing of common dies for it, may be found at this link:

http://tinyurl.com/yy263j

Happy hunting.

I have listened to hundreds of CW contacts, and the above is mostly the norm. I exaggerate a bit, but it is rare that anyone talks about anything other than a few very simple things. I have yet to listen to a complex conversation on CW... The most complicated thing I have heard is W1AW code practice, and some of the traffic nets.

Well, you wouldn't if you spent all of your time on CW. Things are very polite on those subbands. If however, you ever listened to 20 meters around 14.313, you might have a different idea of what ham radio was about. For some reason that frequency was full of profane garbage mouthed hams, and lots of infighting in the '70s and '80s.

Perhaps, but nothing like some of the very cheap sweep tube transceivers of the late 1960's, and early '70's. Swans that drifted furiously, and practically invented the term TVI...

What are the bad HF SSB rigs of today? I would bet that even the absolute worst is cleaner than anything that was available in the '60's, and '70's... If only because the regulations got tighter on spurious emissions from new gear.

Nope, I did my Advanced from basic principles. I used the ARRL Radio Amateur's Handbook as my guide to rules and regulations. The technical side of my studying came from the handbook, and a variety of other radio and engineering sources.

>
> It did not have the exact questions and answers in it.

I looked at friend's copy of one of the the license manuals that was available after my test, and the questions and answers were very close. It was nothing like the manuals that are available today, but still so close as to be a cheat.

I have built and operated a number of entirely home brew radios. Slow Code is the one complaining about appliance operators, of which it appears he is one.

Listening is one thing, participating is another. I've had many, many
CW QSOs that were far more complex than your example. Discussions of
rigs, antennas, jobs, family, plans for the near future (vacation, home
improvement, etc.), experiences in the other's location, and much more.

The stereotypical hello/goodbye QSO is usually the result of these
factors: poor conditions, unskilled operator(s), nature of the QSO (DX,
contest, just checking a new rig)

Of course somebody has to initiate - to say something beyond hello...

Well, I don't know about you. But for me, knowing Morse Code meant I
could build and use simple(r) radio systems to try out an idea.

If someone who isn't a trained electronics person wants to design and
build their amateur radio station, what sort of project should they
build? A complete multiband SSB transceiver? Or a simple CW rig?

Good point!

Isn't that a reason to promote the mode?

Sure. But how many hams were involved, out of the hundreds of thousands
on the air?

> >>>>> I haven't noticed that things are any worse now. About the only real

Sure - but remember that those rigs were designed 40+ years ago. They
should be judged by the standards of their time.
>
> What are the bad HF SSB rigs of today? I would bet that even the absolute
> worst is cleaner than anything that was available in the '60's, and '70's...

It depends on what you consider "bad". Last FD we had some rigs that
were unusable because they put out wideband phase noise that messed up
stations on adjacent bands! Those rigs might have met the letter of the
law when new, but they sure made a lot of hash in the real world.

OTOH, serviceability of many ham rigs is very low. Even if you can deal
with SMT, a lot of them use house-numbered parts that become unobtanium
in a few years.

Same here - all the way to Extra in 1970.

> > It did not have the exact questions and answers in it.
>

There were a couple of different license manuals available back then.

The ARRL LM was a reprint of FCC's study guide. Those FCC study guides
were produced by FCC to indicate the areas of knowledge you needed to
have for the test. They were essay format even though the tests were
multiple-choice.

AMECO and others rewrote them into multiple choice format.

A fellow named Dick Bash stationed himself outside FCC offices and bought information from people who had just taken the tests. He was able to recreate a pretty close version of the actual test by that method. FCC decided not to prosecute him even though he published books that were very close to the actual tests.

Then it all became academic with the VE system.

Yup.

Exactly. *You* are not an appliance operator - nor are you calling anybody else an appliance operator.

> Slow Code
> is the one complaining about appliance operators, of which it appears
> he is one.

Exactly. I didn't mean to imply that *you* were an appliance operator, Chuck. Just that if "Slow Code" is going to call other people names, he should be ready to back up his claims with actions. So far, we see nothing.

Of course, one should not take "Slow Code" too seriously - if at all.

Kenwood TS-820S. I got a good deal because it had a few bugs. I spent
some of the evenings between the exam session and my ticket arriving
(that would be my GENERAL ticket, I skipped Novice and Technician) going
through it cleaning switches, adding ground straps to a couple circuit
boards and adding 17m to the 'AUX' position on the band switch. By the
time my ticket arrived in the mail it was ready. I worked Clipperton
Island the second day I was on the air and didn't realize it was quite
the DX catch until months later.

So, after your license came in the mail what did you start weenie
whining about first?

W8LNA

To promote the mode, sure, but to require it no. I could make the same claim about RTTY, and Slow Scan. When they were popular, folks on those modes were all as polite as could be.

The impolite behavior seems to center around SSB. Probably because the mode requires essentially no effort.

>> If however, you ever listened to 20 meters

It only takes a few. As I remember from those SSB wars in the '70's and '80's, a several hams were prosecuted. They were all General Class or higher. And because of the time frame, in which they were licensed, they had passed the CW hurdle. I recall that playing with their keyers on the SSB segment was part of their hijinks. A whole lot of "FU" and other acronyms were mixed in with the echo boxes, and microphone raking.

And I was. But today's rigs, when judged by the ear are more pleasant to listen to.

Fortunately, that wideband phase noise doesn't carry beyond a few hundred yards from the radio. It used to be a really big problem with the early solid state radios... But not so much so with the newer rigs. Field Day was where I first noticed the effect.... Key the mike, and all bands were awash in hiss, even before the first word was spoken. Icom comes to mind.

Having a Clegg FM27B around on field day is a real treat too...not!

Entirely the result of meeting the customer's demands for in expensive
feature laden radios that fit in packages smaller than a dictionary.

I think my friends "manual" might have been Ameco.

I don't think Bash was doing that until after the VE system came on line...
but I don't recall for sure.

...

Actually, these days for what little operating I do, I am an appliance
operator. Because of my early ham experience, and the fact that I am
an EE, I know how to design and build, even if I don't chose to do so
right now. Ham radio probably figures heavily in my being an EE.

My general belief is if you have passed the test that is in force, you
are a ham... period. Beyond passing whatever is required, I don't care
how you got here, just what you do now that you are here.

-Chuck

funny how the result now is to transfer a lot of the rudeness to CW

Why using stepmotors.

Try to get syngons (or synchrons) instead. These are motor-alike things
that you feed with AC and when you turn one of them, the other reciproces.
It's like a radio controlled servo but without the usual QRM from the
motors.

Cheers

Dan / M0DFI

One way to promote a mode is to give it significant band space.

> I could make the same claim
> about RTTY, and Slow Scan.  When they were popular, folks on those modes were

The difference is that only Morse Code requires skills that the average
person does not have.
```

Maybe. I think there are many causes.

They were a few out of hundreds of thousands.

And yes, they all passed the Morse Code test - supposedly, anyhow. But
they also passed one or more *written* tests which included questions
on acceptable on-air behavior. Why don't the written tests get the
blame?

Look at the recent case of Jack Gerritsen, ex-KG6IRO. What possible
reason is there for his behavior?

Some are, some aren't - IMHO.

The rigs that gave us headaches were only a few years old.

> Field Day was

Bingo.

Are those really customer demands, or are they driven by the
manufacturers who want to sell more radios?

Very possible.

> but I don't recall for sure.

It was the other way around. Bash did his thing in the early 1970s. The
VE system came to be in the early 1980s. The VE system put Bash out of
business because the question pools became public then.

Same here - except I'm still homebrewing.

> My general belief is if you have passed the test that is in force, you

Agreed!

> Beyond passing whatever is required, I don't care
> how you got here, just what you do now that you are here.

Agreed again!

why does that justify the rudeness of it operators Jim?

Slow Mind does not know that a Real Ham only uses a radio he built
himself. A Real Ham would not use one of those crappy store-bought
things.

  ATTENTION USENET VISITORS, THIS AREA HAS BEEN
  DECLARED A TROLL WILDLIFE REFUGE.   TO LEARN ABOUT
  THE TROLL, ITS HABITAT, AND  ITS WAY OF LIFE, PLEASE
  READ THE SIGN-POST BELOW. IF YOU WOULD LIKE TO LEARN
  MORE ABOUT THE TROLL,  YOU CAN PICK UP BOOKS AND
  SOUVENIRS IN THE GIFT SHOP AT THE END OF THE TOUR.
  THANK YOU IN ADVANCE FOR OBSERVING ALL TROLL WILDLIFE
  REFUGE RULES, HAVE A NICE DAY.

 -----------------------------------------
 |  Common name: Woodland Troll          |
 |  Scientific name: Trollus Useneticus  |
 -----------------------------------------

#############################################################
```

```
#                                                          #
#              PHYSICAL CHARACTERISTICS:                  #
#                                                          #
#  The common woodland troll (Trollus Useneticus) is an    #
#  approximately 1.7m long nocturnal furry creature that   #
#  has been found to exist in nearly every climate and     #
#  latitude.  Predominant features include: a very pale    #
#  complexion, a large bony ridge above the eyes, a dense  #
#  cranium, dragging knuckles, and a pungent odor.         #
#                                                          #
############################################################

############################################################
#                                                          #
#                        HABITAT:                         #
#                                                          #
#  Most trolls spend the daylight hours under a large rock #
#  sleeping.  Unfortunately, the natural habitat of the    #
#  troll has been encroached by development (as is all too #
#  common these days).  The modern troll has to make due   #
#  with a slimy, moss covered rock.  Often, trolls are     #
#  forced to endure poor sanitation and filthy living      #
#  conditions.  Combined with the general lack of hygiene  #
#  among trolls, this results in a very unpleasant odor.   #
#                                                          #
############################################################

############################################################
#                                                          #
#                ACTIVITIES AND DIET:                     #
#                                                          #
#  During their active period at night, the common troll   #
#  engages in numerous activities, though the most         #
#  important of these is foraging for food.  The one       #
#  characteristic that ties all different troll species    #
#  and sub-species together is their diet.  Trolls         #
#  invariably survive off of a combination of cheetos,     #
#  arguments, and annoying others.  A typical troll        #
#  requires approximately 10 arguments and flames per day  #
#  just to stay alive.  With the increasing use of         #
#  killfiles and just regular ignoring of trolls, it has   #
#  become more and more difficult for trolls to eke out a  #
#  basic sustenance.                                       #
#                                                          #
############################################################

############################################################
```

```
#                                                          #
#                     KNOWN PREDATORS:                     #
#                                                          #
#  Unfortunately, trolls have many predators.  Most common #
#  among them are the helpful researcher, the informative  #
#  poster, the cool headed responder, and the kill-filer.  #
#  The cool header responder is technically not a troll    #
#  predator however.  Trolls are typically unfazed by      #
#  logical counter arguments and cool headed reason.       #
#  However, even though their posts do not deliver the     #
#  same level of sustenance that a "flamer" or an "annoyed #
#  poster" may provide, they still provide a valuable      #
#  source of dietary fiber for the troll.                  #
#                                                          #
#  The most dangerous predators for the trolls are the     #
#  helpful researcher, the informative poster, and the     #
#  kill-filer.  The common troll is highly allergic to     #
#  fact, real data, and research.  Upon skin contact with  #
#  actual hard evidence and real data, the troll will      #
#  experience intense itching and burning at the site of   #
#  contact, followed by lesions and blisters.  Eventually, #
#  this results in loss of skin near the area of contact,  #
#  and usually to loss of a limb (in the example of        #
#  contact near the arm or leg).  Contact with facts and   #
#  data near the facial area usually results in a slow     #
#  painful death.  Contact with extremely high doses of    #
#  fact and hard data can cause temporary loss of          #
#  consciousness and even permanent brain damage for the   #
#  troll.                                                  #
#                                                          #
#  The kill-filer poses a much more insidious threat to    #
#  the troll.  Not posing a direct threat to the troll per #
#  se, the kill-filer simply deprives the troll of yet     #
#  another source of nourishment. Some trolls have         #
#  developed counter measures to thwart the kill-filers,   #
#  usually this takes the form of a type of camoflage.     #
#                                                          #
#  The trolls' predators have reaped a terrible slaughter  #
#  over the years, resulting in the death of great hordes  #
#  of trolls.  Trolls continue to breed rapidly though and #
#  their population is stable.  However, it is unknown how #
#  long this situation can persist.  Eventually, natural   #
#  predators and poachers may result in lower numbers of   #
#  trolls.  Already we are seeing lower diversity among    #
#  the different troll species.  That is why this troll    #
#  habitat refuge exists, to ensure the preservation of    #
#  the troll for not only our future, but the future of    #
#  our children.                                           #
#                                                          #

I'm sure a lot of hams migrated from citizens band, but up until about the
last 16 years, they had to pass a real ham test to get in. Not dumbed
down tests like we have today.

It's nice to see a couple 11 meter jockeys agreeing with each other.

I made a lot of contacts on CW. I knew it was what I had to do to be a
valuable asset to the service and I had a lot of fun communicating with
other CW ops around the world. I was always surprised at how good the
Russians were at CW.   Doing CW helped me get get my skills up and I
quickly passed my 20 wpm Extra. (the real Extra)

Now I try to help other hams and potential hams on radio and on usenet,
but the usenet hams are so lazy they don't want to learn anything. They
want licensing to be dumbed down some more.

I want to build a low pass filter for 1296 and have scaled a design out of the handbook. I would like to use chip inductors and chip capacitors for the filter. I was looking at thin film chip inductors (Digi-Key) and they list the self resonant frequency. For an inductor passing 1296, what should the minimum self resonant frequency be? Is 10 GHz enough? The filter is a 5 element Chebyshev Low Pass Filter, inductive input (3 coils in series with a cap at each inner junction to ground), Fco=1290 MHz, F-20dB=2600 MHz. Any other component specs I need to be aware of?

Scott

10Ghz would be *almost* an order of magnitude away from the frequency of interest. That should be more than sufficient. The higher the self-resonant frequency, the less parallel capacitance is involved which makes "trimming" the filter less involved. At this frequency your capacitors are going to be pretty small. Parasitic capacitances, such as in the inductor, can make things look pretty screwy in a big hurry.

Inductance of the capacitors, capacitance of the inductors, and loss of
both will all affect the quality of the filter. Parasitic inductances
and capacitances in the connecting lines and mounting pads will play a
role also. Your problem probably won't be so much getting decent
response to 2600 MHz (although it won't be easy), but maintaining good
attenuation for some range above that. Take a careful look at the
highest frequency you have to reject and the required attenuation at
that frequency, then decide whether your components will behave as
expected up there.

Thanks for the replies...I will probably give it a go and see what happens. I will order values of inductors and capacitors on both sides of my calculated values and play with the circuit until (if) I can get it to work OK. Maybe an appropriate helical filter might be the way to go...

Believe me, you do NOT want that to happen, even if it brings
back "civility"! Do you want to live in a police state? One thing is for
sure: I WILL go to WAR (on all levels. it depends) agains my own government
if and when that happens.

Rick Frazier wrote:

No you don't, you come here and grind your ax for some reason. You want to help? Be positive about ham radio, all of ham radio and not just the niche you want to inhabit. Open your eyes, see the whole hobby and realize those that don't share your tastes are just as competent or incompetent as you.

> but the usenet hams are so lazy they don't want to learn anything. They
> want licensing to be dumbed down some more.

Translation: They want to keep up with technology and eliminate testing on methods that are plainly antiquated and waning in usefulness and I don't want things to change so I don't lose my relative (perceived) status among hams.

This website has appeared here a number of times before, so it is hardly "new". It's main purpose seems to be to peddle an amplifier which violates 97.315 and 97.317 ... in fact, it seems designed to maximize the number of subparagraphs that may be violated in a single piece of equipment. The website owner appears to be a U.S. based manufacturer (Illinois).

Why not a microstrip filter? Is it that you must have response from DC
all the way to 1296? Would a "no-tune" bandpass filter be more appropriate?

Hello All,
I was wondering what are the differences between a preamp, RF amp and
an LNA.

I was thinking they are all one and the same. Are there any subtle
differences among them for these names?

Thanks.

They all refer to amplifiers, and might be used interchangeably in some cases.

A "preamp" is generally a low-level amplifier, and to be practical I'd expect it would have reasonably low noise. Like the name suggests, it goes at the front of a signal chain. It's a name used at RF, but also for audio and even sub-audio work.

An RF amp presumably amplifies radio frequencies. That's a pretty broad frequency range, and the particular amplifier might well be tuned to a very narrow band, or optimized for some modest range of frequencies (such as 140-150MHz). There's nothing in the name that says it's low power. It could be an RF power amplifier, delivering kilowatts of output. The term isn't very descriptive, but you could add adjectives to narrow it down, like "a low-noise 2-meter mast mounted receiver RF amp."

A LNA -- low noise amplifier -- generally refers to an RF preamp with good to very good noise figure, commonly mounted at the antenna so as to not degrade the system noise figure with the loss from a transmission line. Because they are most useful at frequencies where the atmospheric noise is low, you probably wouldn't find LNAs for use at 4MHz, but they are very commonly used on dishes at microwave frequencies. But again, there's nothing in the name that really tells you the frequency range. The name could reasonably be adopted by audio folk dealing with tiny signals from transducers like moving-coil phono cartridges.

And of course, others may have slightly different (or even very different) slants on the meanings.

Cheers,
Tom

Adding to what others have already posted, you can simulate the filter, with parasitic resistances and reactances and the inevitable transmission line effects, in the freeware RFSim99. You have to be careful to think about the physical layout, and see everything longer than a couple millimeters as a transmission line. The data sheets on the discrete parts should give you a decent idea about the parasitic R/L/C of each package. RFSim99 includes the ability to model self-resonance and Q in inductors and capacitors without adding more parts to the schematic; just check the "use physical model" box for those parts you want to specify for Q and SRF.

And I'd echo what Tim wrote, too: you might want to consider a distributed filter, especially if you can make a PC board with reasonable accuracy. Also, if the goal is to kill harmonics of a single narrow band, you may do better with notches at the harmonic frequencies.

Cheers,
Tom

well i bought the pcb from rf parts..it arrived today..but i forgot to order the pcb layout info..its for the 140w push pull amp based on the motorola design..anyone got the pcb layout info please?????

i wanna build it,and i know i could work it all out ,but it will save hours of work if someone (prehaps in the usa)has the info...

thanks g0zen

Hi gang,

Is it not feasible to use a crowbar circuit across a PSU's output if that PSU has a current-limiting feature? I can imagine a situation arising where an over-voltage causes the crowbar to close, generating a short-circuit condition which activates the current limiting. The output will then be stuck at not enough amps to blow the upstream fuse, but enough current to smoke the crowbar (which is not designed to be kept conducting for any length of time of course). Is there some way to have both over-current and over-voltage protection working together in harmony?
Thanks.
p.

I see no problem. If the crowbar is active, the voltage accross it is
about 0V so power dissipation in the crowbar device is minimal. You
could probably use a SOT23 trenchFET as a crowbar which would be
capable of handling a few amps.

Most supplies I've seen with both crowbar and current limiting use fold-back current limiting. When the current exceeds the set limit (due to too heavy a load or to the crowbar firing), the current drops back to a level considerably lower than the limit current, and one which the crowbar can tolerate indefinitely.

Well, it might, but I'm not 100% sure how to determine the lengths and widths of the microstrips. (On my present project, I'm trying an open 1/4 wavelength 50 ohm stripline that I can trim down in length in an attempt to make that line a "short" at the 2nd harmonic.)

The filter only needs to pass from about 1296 to 1300 MHz. I like the idea of a helical filter (except for the cost!) with steep skirts and since my I.F. will be 432 MHz, it will be far enough away so the image will be quite a ways removed and should be way down in level after the filter.

That's exactly what I'm trying on my present project at 902. I have a 50 microstrip line on the circuit board where the RF connector hooks up. I will etch it to be a 1/4 wavelength at 1802 MHz (2nd harmonic) and see how that works. If it works OK, I may try the same at 1296...I might also go with a helical filter...they work nice but can be a bit pricey!

Roy Lewallen wrote:

> Most supplies I've seen with both crowbar and current limiting use fold-back current limiting. When the current exceeds the set limit (due to too heavy a load or to the crowbar firing), the current drops back to a level considerably lower than the limit current, and one which the crowbar can tolerate indefinitely.

Yeah, and not only the crowbar, but the supply itself can likely tolerate it better! :-) Especially if it's a linear supply. Paul: imagine a linear supply designed to deliver 24V at a couple amps. The input to the regulator part might well be nominally 30 volts or more, to accomodate low line input and drop in the regulator pass element. At high line, it might be 33V. In normal operation, the regulator might drop 9 volts at a couple amps, dissipating 18 watts. An SCR crowbar might drop 1.5V. At 2 amps, that only 3 watts, but the regulator would be dissipating over 60 watts. But with foldback limiting, the dissipation would drop in both the SCR and the regulator,

staying in pretty much a constant ratio. With a switching regulator,
things probably wouldn't be nearly as bad, but the dissipation may
still go up in the switching parts if you short the output.

The other thing I've seen is a crowbar for fast response, and a
latching shutdown fed back to the supply that holds it off until
something is reset.

Cheers,
Tom

Look up the Astron supplies. They will go into a current limiating mode if the over voltage protection activates. That is if there is a spike or something. Most of the time something fails (say the pass transistors) that makes the supply go into the over voltage condition and due to the failed component the supply can not go into the current limit mode.

Well, most of Helge Granberg's Application Notes are on the Internet (in
various places)

Mike Grierson G3TSO built his 140 watt HF amplifier also based upon Helge's
design,
using the Communication Concepts (CCI) printed circuit board.

Was this the VHF (2-meter) or HF amplifier TX100F from RF Parts ?

it was the tx100 i guess...anyway the links you put up are the ones i
have..(except the component layout ,as i forgot to order!!)

yes you are correct in stating they are based on h.granbergs designs,which i have,as i stated i guess i could work it out,but it would be much easier to know the component layout for this pcb..as it is not exactly as per his design..

regards

You are correct -- this RF Parts kit product is NOT a duplicate of Helge's
design as found in the Application bulletins.

As you have realized you should have ordered the "Plans kit" -- which
included the TX100 circuit board
and the component layout instructions/building that you need.
They just went home (California) for weekend about 2 hours ago --
so send them an e-mail or contact them next week.

All Customer Service, please e-mail: mailto:customerservice@rfparts.com

We endeavor to respond to all e-mails within 24 hours (with the exception of weekends). To help, please keep this in mind:

. E-mails sent Monday-Friday before noon PST are usually answered same day.
. E-mails sent Friday after noon are usually answered on Monday.
. E-mails sent on Saturday and Sunday are answered on Monday.

While e-mail is very convenient, it is not the quickest method to reach us. For faster service, or in case of emergency, please call us at (760) 744-0700.

Isn't it possible to make a helical resonator with a helix of wire inside a box made from soldered-together pieces of PC board?(*) A filter could be made from a series of these. The Q might not be optimum, but should be good enough for a lot of purposes.

(*) I actually made a two-resonator filter for 450 MHz using this method long ago, but it didn't work well. I came across it recently and checked it with a network analyzer -- I had no decent test equipment back when I made it -- and found that the sections were severely undercoupled. But I haven't tried modifying it to see if it could have been made to work as intended.

Yes, that's all a helical filter appears to be...a coil inside a metal box. I have no idea how many turns, turn spacing and anything else that might be important to the design of one. Fortunately, Downeast Microwave sells a bunch of different helicals for a LOT less than Digikey, but I need the 1305 MHz set and I don't see them at DEMI, so I'll have to fork out $26 each from Digikey (and probably will end up using two) ;(

Offhand, I'd be tempted to use an interdigital filter. There was a nice article about this, including a computer program in basic for the caculations in Ham Radio magizine, Ummm... November 1985 (?).

I used this in a 2400 MHz filter I needed one time and I found the skirt selectivity to be pretty good. Of course, like a lot of wavelength related filters, it had harmonic responses, but a low pass filter fixed that quite nicely.

One pb with SMPS is that when you crowbar its output the input current
is lowered since you ask for lower output power. You'll never blow the fuse.
Another point, depending on the SMPS structure and on the controller
minimum on time is that you have pretty low output voltage when
crowbared (?) which may be too low to reset the inductor current (for
ex. flyback, buck).
In some poorly design supplies this might lead to higher and higher
switch/diode currents, inductor saturation, sill higher currents and
then fireworks.
I prefer latching the fault condition then inhibit the controller, with
crowbar or not, which is what you recommend below.

> The other thing I've seen is a crowbar for fast response, and a
> latching shutdown fed back to the supply that holds it off until

I have also found that upon making this the swr can start off high.

What i did was get a small piece of pipe(non cond) and wrap the braded wire around this about 4-6 times. this stebled thing's out and brought the swr down to 1.4. using slight ajustments to the lenth and coil gap of the braded wire and keeping the coax from touching the floor you can get the swr down to 1.2. so got a load of spare coax and a swr meter then why not have a go and see if you can improve it again

If this is just a basic IF transformer, you could just buy a radio
and extract the transformer.  The radios will be available locally,
unlike just the IF transformer (unless you are lucky enough to be in a
city that still has a store that would carry them).

Buy a radio at a garage sale or a place like the Salvation Army,
and it won't even cost much.

Are conversations on repeaters as technical as they were twenty-five years ago?

Me? I hear no-codes and nickle extras arguing how long a half wave dipole should be.

Oh, easily. 25 years ago, technical conversations were dominated by such earth
shatteringly important stuff as having a ham down at the repeater site helping

other hams tune their transmitters to be on frequency. Other wonderkind were hitting the repeater with a full quieting signal, and turning their power up to try and get a better signal to that DX mobile that breaking up.

If it wasn't that, it was an endless sea of autopatches calling the xyl to tell her that traffic was bad, could she start dinner... or ordering pizza.

>
> Me? I hear no-codes and nickle extras arguing how long a half wave dipole
> should be.

I heard the same things 25 years ago from Generals that got their licenses at the offices of the FCC.

Even 34 years ago, there were study guides that had questions from the pool used by the FCC. If you could memorize the answers to those questions, you were virtually assured of passing. I used the ARRL handbook as my guide.

You didn't answer my questions about the home brew rig you are using.

-Chuck

Hundreds of sources. You looking for traditional cans used in tubes
equipment or PC board mount (transistors radios)

Gold Mine sell 20 can for $ 2.50 (PC mount versions)

Local hamfests here I see NOS 455 kHZ and 10.7 MHz IF cans (case of them) --
in chassis mount style (tube radios).

A Google search should help.

Hi all,

Is there an easy way to test surplus toroids as to what mix they might be?
```

I have some here with no markings (plain black powder) and I would like to
see what frequency ranges they would be useful at. I guess I would have to
wind up a transformer and plot the frequency response?

An Amidon or Ferrite catalog will then give you any other charactersitics
you require.

I had some of my ferrite cores mixed up in my junkbox. What I did is thread them on to a
wire and mark them..so they wouldnt get mixed up again. I took some known torroids and
did some inductance tests at various frequencies ..with 3 or 4 turns of a 7 inch wire. I then
matched up the types that got mixed up. They were all ft37-43 and similar sized other ones of different permeability.
Now with types that are surplus from unknown origin..you may be able to match up inductance vs frequency graphs and match them up to known types of similar/same size.
Ferrites are often used in broadband applications..ie 1.8 to 30 mhz..therefore you have to
select a number of frequencies for test measurements. I use the a frequency in each amateur band.
See my web site:http://www.earlandrews.com for some more details. I use an autek rf analyser for my inductance measurements. I may get around to publishing more on this topic on my web pages this winter..stay tuned. Also..another method is to measure the actual resistance of the core with an ohmeter. I found this to be a very hit and miss and

rather difficult method. The inductance vs. Frequency method is
easier..but you need a test instrument ..and TIME!! 73 Earl VE3AB

There seems to be a misconception that all iron dust cores are made by
Micrometals and often marketed under the Amidon brand name and that
all ferrite cores are made by Fair-Rite :-).

You can not assume that any colour coding system used by some
manufacturer would apply universally.

> circuit.

Something I've found myself -- and several considerably experienced RF
designers have verified -- is that RF coupling and bypass capacitors are
often nowhere near as critical as you might think they are. On a real
circuit board, by the time you start getting close to the SRF of even a

100nF capacitor, there's usually enough parasitic coupling that what the capacitor is doing just doesn't matter that much. I've used 100nF coupling caps in paths all the way up to 3GHz, and while you *can* see a difference in S21 compared to using, e.g., 10pF, it's really, really small... like, under 1/4dB, and thus the overall response is usually swamped by active devices, loads, etc.

Thus I'm not at all surprised the OP saw absolutely no different when he reduced the 10nF caps to 200pF.

That being said, I wouldn't throw a larger-than-necessary cap into an RF path without good reason. My main point is that the problem of providing wideband coupling is often nowhere near as difficult as it first appears. On the other hand, this implies the well-known corollary that isolation is often a lot *harder* to achieve than we'd like.

---Joel

The problem is that, if you have 140dB gain at one frequency, you need *over 140dB isolation* from your final output back to the original input to prevent oscillations from occurring.

140dB isolation is very difficult for reasonable amounts of money!

hello i always figured this would never happen to me but my heart is having serious issuses do to a birth defect (i was born with a hole in my heart)and need money to have the surgery to get the hole fix so i am asking for donations to help with the cost since i dont have insurance so if you have a paypal account please look into your heart and donate a dollar or two my paypal emial is mcollins7373@msn.com i need around 20,000 dollars usd to have the surgery done. This is my last resort for money i have
tried goverment agencies family and friends and to my dissapointment nothing happened SO PLEASE I NEED HELP thank you so much mike collins

P.S. THANKS FOR ALL THE HATE MAIL WHERE WOULD THE WORLD BE WITHOUT HATERS

Magnetic materials do not have a universal colour code like resistors. Their properties are much more complex, including shape and size, and the magnetic properties also depend very much on the ingredients and the processing. Rather like bread, no two products are exactly the same, and it's hard work for manufacturers to maintain consistent quality even in the same material.

If someone has good reason to believe that the cores were made in the USA, then they may well be identifiable from the Micrometals, Amidon or Fair-Rite catalogs. Unless it's a custom shape, the exact dimensions are often the best clue about which company's catalogue to look in. Then a few electrical tests should help to identify one of that company's standard mixes.

On the other hand, cores from other manufacturers and other parts of the world could be almost anything! The only thing you know for sure is that they are NOT made from any "US standard" mix, so they're going to need a separate drawer or bag of their own.

Living in Europe, I have given up buying surplus cores "just in case" they might be useful, because they have almost all been a waste of money and storage space. After wasting time trying to measure and classify them, they have always turned out to be the wrong material or the wrong size for what I needed. As a result of that experience, I now keep almost no stocks of magnetic cores of any kind.

Instead, I keep the money in my pocket, and then buy exactly the right ones for each project, as and when they are needed.

I keep a modest collection of many useful types of cores that I bought from Amidon, from their excellent complete Catalog. The initial expense was a couple of hundred dollars about 15 years ago, but I know exactly what I have, and I save a lot of time and trouble. When I run low on some type I order replacements. I store them in plastic zipper bags with labels. For home experimenting it is a very good way to go. I also have an ancient Boonton Q meter and an ancient surplus HP Vector Impedance Meter.

Yes. My meter is used for low level RF measurement. Primarily I have been using it for LO measurement and crystal filter construction. It waspretty simple to build ugly style. The June 2001 article by Bob Larkin is a good article to read. Calibration will be a concern. I also created a spreadsheet using the slope formulas provided in excel. I guarentee you will fine it useful.

AADE has a kit.

Well, I wound 6 turns of #26 enamel magnet wire onto on of the surplus toroids. It measures an whopping 714uH on my Almost All Digital Electronics LC meter.

The toroid measures a bit less than 1 inch OD but definitely more than 0.94". I don't have a set of calipers here but it looks to be about 0.97" based on the ruler I have. The ID is about 0.50 inches. The thickness is about 0.34". These dimensions don't seem to be standard. By the way, here is the listing for these toroids:

    http://www.goldmine-elec-products.com/prodinfo.asp?number=G6683

This inductance seems way too high - either I'm getting a false reading or else this not a good material to make RF transformers / inductors with?

I'm mostly working with 2 to 30 Mhz so I am looking for some stuff for that range.

thanks all,

Dave

Built one using an 8307, A/D, and Stamp II. As the other poster mentioned, depending on what you want to do with it, calibration can be an issue, for both frequency and amplitude. "Dead bug" style construction works well with this part, providing a solid ground plane.

Oh, and look on eBay for HP 436 and 437 wattmeters. That part is cheap. The expensive part is the probe -- 8481, 8482. But even without the probe, the 436 and 437 have reference sources that put out 1mW into 50 ohms at 50 MHz with better than 1% accuracy.

omit the usual to e-mail me.

Hi; my first post so hope it works.

Yes, I built mine largely on the Kopski circuit. Manhattan construction.

I made a separate measuring head in a small diecast box with a cable which plugs-in to the meter unit via a microphone plug/socket.

I also made another head in an identical little box; it contains a return-loss bridge with an AD8307 as the detector. Works fine up to 650 MHz. It allows quick & accurate return-loss measurements; I call it my poor man's scalar network analyser. :)

Kerry VK2TIL.

i have always wanted to build a step motor driven
balanced tuner. i have acquired an excellent tx air capacitor
and 2 matched 28 uh roller inductors. next step is
to acquire 2 step motors with some kind of positioning
indicator, either optical or a pot.

any have any recommendations for a company site, or for
anyting else related, pulleys, belts, encoders etc

larry

I took a receiver design class at Rockwell-Collins when I was working for them. The guidelines given at the class were no more than 70dB gain at any single frequency. Any more than that, an instability can result. One of my instructers in college told me that with the old school of design, allow at least 1/2 inch of length for each 40dB of gain at a single frequency, and even with those parameters, interstage shields would be necessary. One technique that radio manufacturers is "egg crate" construction.............a die-cast chassis with 1/16th inch walls separating each compartment that contains a module is used.

The better RF generators also use this scheme. Examples of a receiver and RF generator are the Racal 6790/GM and the Boonton 103D, respectively.

If you are still curious if your idea will work or not, I suggest that you actually build the cascaded lineup and find out what happens. Sometimes, the best way to learn about these things is to experience them yourself. I remember the first cascaded amplifier lineup I built when I was going to school. When I asked my instructor why the circuit was oscillating, he asked me where the decoupling networks were. I asked him "decoupling what?". Oh, that's what those 100 ohm / .01uF RC networks were that I used to see in series with the collector/drain resistors. I used to jump out those 100 ohm resistors, thinking that the extra collector/drain voltage would somehow give the radio more gain!

It is always good to ask questions on the NG, but the best way to learn is to actually build the circuit yourself. Nothing like the "school of hard knocks".

Some places you'll find surplus steppers:
  Marlin P. Jones Associates, www.mpja.com
  Surplus Center, www.surpluscenter.com (usually not many steppers, though)
  Herbach & Rademan, www.herbach.com
There are plenty of others. Some of these also have other drive components. You may also find just what you need in an old printer or pen plotter. I have a friend who has a bunch of big old printers and keeps talking about cleaning out his garage. He'd probably give you one for free, but you'd have to ship it. You may have someone like that near you.

You may need to gear down (or otherwise step down the speed) of the motor to get enough torque to drive the capacitor and inductors.

Especially if you use steppers, you may only need to detect a "home" position, since you can count steps from there and know where you are (or rather where the capacitor and inductors are). A continuous servo system may only need to know the ends of travel, to know that it can't go beyond those points.

If you want it to auto-tune, you may find it easier to just use DC motors, though doing so successfully would probably take some understanding of servo control systems.

Cheers,
Tom

If you decide to use DC motors, and if you decide to drive them from a microprocessor (which would be indicated if you're planning on tuning it under computer control or auto-tuning), this may help: http://www.wescottdesign.com/articles/pidwophd.html.

But I'm not sure that it would be necessary -- as long as you've got _something_ that'll locate the variable components where you want them and does so reliably it doesn't matter whether they're DC motors or steppers.

Be careful sizing your steppers. The biggest drawback to designing with steppers is that if you exceed their available torque they'll quietly fail, and your system will do Very Bad Things. So you want to over-specify your stepper motors by quite a bit.

You'll need to consider two things when doing this: the amount of torque it takes to turn your inductors, and their rotational inertia (which will determine how fast you can accelerate them without causing grief). You can determine your necessary torque experimentally with a lever arm and weights, and you can determine your torque available from a 'mystery motor' in a similar manner -- there's even a web page out there to tell you how to do it, if you look for it.

Once you have selected steppers that are big enough, you'll know their other drawback: they take up a lot of space compared to DC motors with feedback.

But it's easy to understand how to control them, and you don't need to figure out complicated position feedback schemes, so maybe steppers are the right choice for you. If I were you I'd just use a stepper and a pair of home switches -- one to tell me that the roller is at one extreme of travel, and another to tell me that the drum has passed by an index mark. If you 'and' these two signals together you'll get a reliable home. Then each time your system starts up you just run the steppers down to the home position, and back to where you want them.

Construction projects you or I have done aren't important. Working to
insure ham radio doesn't turn into CB is important. Agreed?

There is a way around the initial high torque, like friction loads etc. You can use torsion spring/shaft to delay the application of torque to the step motor. Had that problem back at IBM and solved it with torsion shaft spring (Allen key), had invention disclosure on it and it was the only way to get around the problem due to limited space/size of the motor.

Oh, I agree, but if you do too, then I have trouble understanding why
you are ragging on folks that are using store bought radios.

SC, tell us all, and don't lie. Do you not agree that a LOT of hams today
were CB'ers in the '70's and chose to advance their radio skills by
advancing to ham radio? If you disagree, then 1) you're a liar, and 2) did
this not help the service? And thusly, if you disagree I suspect you fit
into this mold, and choose to deny your past.

Well, in my part of the world, and the parts I can talk to lately, the most negative issues around "ham radio" are on the internet newsgroups, not on the airwaves.   It is unfortunate that anyone would take the rantings and attacks of the few obviously "impaired" individuals that continually post crap in the newsgroups, as something that is indicative of the general state of "Radio Hammery". As with any human endeavor, there will always be some bad apples, and in usenet newsgroups, there is absolutely NO filter to keep out the people who wish to disrupt everyone else. At least not yet. Someday, when we all pay for our posts (it's coming, believe me) and we all digitally sign our posts to ensure we are who we say we are, then maybe we'll have civility and normalcy come back to the newsgroups. Until then, at least, the comraderie and decency of true hams will still shine out on the air, in good times and during emergencies, and we will all be seen for what we are, not what a few whackos would like you to believe we are turning into....

Thanks
--Rick AH7H

If M3 is the answer, it's a silly question! wrote:
> A necessary preface.....
>
> (It is becoming increasingly difficult to fly the flag for decency and for civilised behaviour in Radio Hammery. Even the Usenet newsgroups dedicated to the cause have degenerated into a hotbed of abusive onslaughts by those who ought to know better; the Nugatory Numpties who boast of an interest exceeding 10, 20, 30, 40 or even 50 years and yet who have proved themselves incapable of even meeting the trivial exam standards set for 6-year-olds. However, there still exists the fundamental basis on which Ham Radio is based, and that will never die. This FAQ ("What Is Ham Radio?") will be regularly published and will not be shouted or bullied down. It is important that those of a technical bent, who are the natural seed-corn of Radio Hammery and who gravitate towards us to be the real novitiate, can still find us, (and know that we are still here), their fellows.)

Dear Slow, I'm a new ham. I passed my Novice Exams in November of
1986, so in Ham Years, I'm a new ham.

What do I like best about appliance operating? I like the features and
the ease of cleanup. The new GE range we have allows me to scroll up
to the desired operating temperature, and push the "ON" button. Then
"Pre" is shown on the temp readout until the oven comes up to
temperature. And the smooth glass stove top is a snap to cleanup. If
something should boil over, you don't have to lift up the burners and
take the spill pans out, etc. Just a quick wipe with a damp dish
cloth. It doesn't get much better than that.

Thanks for asking.

When you passed the FCC exam - you are an Amateur Radio Operator period --
plain and simple.

Whether you passed a 20 wpm code test or no code - you are a Ham

Whether you had to draw the schematic for a Colpitts Oscillator or not - you
are a Ham

Whether you faced the steely-eyed FCC examiner or a VE -- you are a Ham

Those who say otherwise are shrouded in elitism and a synonym for elitism
is snobbery - plain and simple

This is 2006, not 1920

There isn't a single material that's good for both broadband transformers and high-Q inductors. For broadband transformers, you want a winding impedance that's at least several times (5 - 10 is a usual rule of thumb) the level of impedance the winding is connected to. Unless you're dealing with a lot of power, the sign of the impedance doesn't matter, except that resistive impedance is desirable because it stays relatively constant with frequency and doesn't contribute to undesirable resonances. So high-permeability ("low frequency") ferrite cores are best for this at HF, since they give the highest impedance per turn squared. These cores are also good for EMI suppression because they're free from resonance effects over the HF range and beyond, and they maintain a relatively constant resistive impedance over many decades of frequency. See the Fair-Rite web site for typical values for various materials.

But the impedance of those high-permeability ferrite cores is typically resistive above a few MHz, and the Q is no more than a few over the entire HF range. So they're not suitable for use as high-Q inductors or tuned transformers. For that purpose, you're almost always better off using powdered iron cores. There are some high-frequency ferrites, but they tend to have a high temperature coefficient and have to be used with care if any DC bias is present, since they saturate much more easily than powdered iron. Also, it's often difficult to achieve as good Q with them as with powdered iron. So I generally use high-permeability ferrite for transformers, and powdered iron for high-Q inductors. There are, incidentally, some low frequency powdered irons which aren't suitable for this application at HF and above. I generally use MicroMetals type 6 material, and occasionally type 2.

What you really need to know is the type of ferrite or powdered iron you're dealing with. You can infer this by measuring the low frequency inductance with an inductance meter, then using that information along with the core dimensions to calculate the material permeability. From there, you can find a likely ferrite or powdered iron type and from a manufacturer's web site get the impedance at the frequency of interest. A much more direct way is to simply measure the complex impedance of a one- or few-turn inductor at the frequency of interest with an antenna analyzer or impedance bridge if you have either of those instruments.

BOTH are important.

If you're not running a homebrew or at least home-assembled rig, who
are you to call someone else an appliance operator?

What good are technical *discussions* if they don't translate into
actual working radio systems?

Unfortunately, the Dumb-It-Down no-code ham radio crowd are too lazy to
wipe. They'll still hang around and the rest of us will have to smell
the stink.

wrote:

>Sure Paul. It is as a transmitting antenna for short-range only.

So we are talking about a near field system.

In the far field the ratio between the electric (E) and magnetic (H)
field is constant and is 120 pi or 377 ohms. This field is inversely
proportional to the square of distance since both the electric and
magnetic field is inversely proportional to the distance.

However, very close to the transmitting antenna (near field) the E/H
ratio is no longer 377 ohms. The magnetic field is inversely
proportional to the square of distance and the electric field

inversely proportional to the cube of distance.

There is much debate were the near field ends and were the far field begins. For simple antennas, the distance is less than one wavelength, the value lambda / (2*pi) often appears in literature. For large parabolic reflectors or lasers, the far field begins at hundreds or thousands of wavelengths.

Near field communication systems have been used for decades e.g. in induction loop systems for the hearing impaired, in which a magnetic loop is surrounding the room and audio frequencies are fed into the loop. The headset will pick up the field, amplify the signal and feed it to the ear of the person with reduced hearing. Of course, such systems are now more or less useless due to the stray magnetic fields caused by various inverters.

>Do you know
>about:
>http://www.ancom.no/
>products? They claim their ferrite rod styled antenna works as good
>transmitter. See their patent application.

These seem to be near field devices even at MF, where they seem to operate.

Top posting is a sign of inexperience.  You are probably a newbie on the
net.  Go to news.groups and read the FAQ on Usenet etiquette first.  After
that, come back here and post properly and I will give you my call.

Actually top posting is a sign of *experience*. Us guys that were on the internet back when it was run by darpa always top posted. That was because we were running very slow lines, typically 110 to 300 baud, and it was desirable not to have to wait through the down load of a dozen copies of the same quoted material as we progressed through a thread. Bottom posting forced everyone on the newsgroup to fully download every article waisting tons of our very limited bandwidth and time. Top posting allowed you to get right to the meat of the article in the first few seconds of downloading... and it allowed you the option of continuing to footnotes if you really needed to.

You newbies have dozens of ways of trying to impose your will on the group. Most of your so called rules of etiquette are simply you following the bottom posting convention that was set up as a default on internet explorer. Rn, trn, tin, and other premicrosloth news readers defaulted to top posting.

You are so spoiled by high bandwidth and large amounts of memory that you think that a posting arrives at your machine in its full length instantly.. and for all practical purposes, it does.

I can go either way. I do, however, get very tired of having to scroll through the same old quoted crap at the top of post after post... just to get to the bottom
and find the highly informative, but typical, "me too" tacked onto the end.

Bzzzzzzzzzzzzzzzzzzzzzzzzzzt!

My bullshit detector just went off real loud. Here is an authoritative
statement about ARPANET from one of Comer's books:

"Initially, most of the leased data circuits in the ARPANET operated
at 56 Kbps, a speed considered extremely fast in 1968 but slow by
current standards." -- Douglas E. Comer, Internetworking with TCP/IP,

Volume One, 3rd Edition, Prentice-Hall (1995), page 57.

300 baud, my ass! You should have been on a time sharing machine connected directly to the 56K ARPANET, so don't bother to backpedal by claiming dialup speeds. (And of course Usenet didn't even begin until the 80's, shortly after ARPANET had ended.)

Don't try to bullshit someone who has forgotten more about the subject than you have yet to learn.

Yep, those were the *backbones* of ARPANET. We had *ONE* at the University
of Maryland back in the 1970s. That leased line cost thousands of dollars
per month, and was paid for by darpa. Compare that to the backbones of today
which are measured in terrabits per second. These 56K backbones were
connected to mainframe computers that acted as concentrators, and provided
connections to other mainframes, and to thousands of users on timesharing
systems. Yes, I have that right, *thousands* of users shared a single 56K
backbone.

Those users that were local to the concentrator (eg, in the computer room)
were connected to the mainframe by various speed RS-232 lines, but those who
were on remote dial up connections were connected by good old bell 103,
110 to 300 baud modems.

> 300 baud, my ass! You should have been on a time sharing machine
> connected directly to the 56K ARPANET,

Yep, we were on timesharing machines, Univac 1106's, 1108's, and 1140's,
and as I said, thousands of users shared a single 56K leased line into
Darpanet. Do the math, if you can't, I'll help you:

56K/1000 = 56 bps.

If there were *only* 1000 users vying for the net at the same time, they
could each pump 56bps into the backbone. But there were many many more
than that, and they weren't always needing the net all of the time.
(hence the name concentrator)

  so don't bother to backpedal by

I'm sorry, I don't backpedal for idiots. I don't brake for them either.

> claiming dialup speeds. (And of course Usenet didn't even begin until

Riiiight! Just because you can look up darpa on a wiki somewhere, doesn't
mean you can understand what you have read.

you could just admit to making a mistake but then you can't admit to
error and it would still be a lie since that shit of yours I have
encountered
is you writing on RRAP and other locations

as inded you have that with your gay bashing means you need help you asked
for it robeson
